FRUIT TREES, ROSES

ORNAMENTAL TREES, &c.

FOR THE SEASON 1929

GROWN FOR SALE BY

L. P. ROSEN & SON

FERNHILL NURSERIES

EPPING, N.S.W., AUSTRALIA

(Close to Railway Station—7 minutes)

Telegrams: ROSEN, Epping. Cables: Fernursery, Sydney

'PHONES - Epping 96. After hours: Epping 96 and 58

Established 1901

With the exception of the North and South Coast Lines, distances from Epping are the same as from Sydney. On Northern Lines, take 14 miles away; on the South Coast, add 14 miles to your respective distance from Sydney, and you have the distance from Epping.

As these rates only apply when freights are prepaid, customers are requested to add the amount to their remittance. If sent by parcel rate, and not prepaid, 25 per cent. is added to the above rate at the receiving station. If freight is not enclosed, we will always send to pay. Unattended platforms have always to be prepaid. Insured risk rate 10% extra. Twelve fruit trees weigh from 12 to 18 lbs. packed; 50 trees about 50 to 60 lbs. packed.

STAMPED PARCELS PREPAID RATES (MAIL TRAIN).

Not exceeding	3 lb.	7 lb.	14 lb.	28 lb.	42 lb.	56 lb.	84 lb.	112 lb.	Each additional 28 lb or part thereof.

SINGLE PACKAGE RATES, GOODS TRAIN, FOR NURSERY GOODS.

We are now permitted to send all kinds of Nursery Goods by goods train, at single package rates, if such packages do not exceed 140lb. in weight. This rate is much cheaper than stamped parcel rates, but not so quick or reliable. Freight is the same if paid on arrival, except unattended platforms, which must be prepaid. Minimum weight, 14lbs. Following are the charges:-

Miles.	Package not exceeding 60 lbs.	61 lbs. and not exceeding 90 lbs.	91 lbs. and not exceeding 112 lbs.	113 lbs. and not exceeding 140 lbs.

PARCEL POST RATES (PREPAID ONLY).

This way of despatching is suitable for those living a long distance from the railway. We can always select small trees or cut hard back for such orders. Six rose plants weigh 2 to 3lb., 12 rose plants weigh 5 to 7lb., and 10 small fruit trees would weigh about 7 to 10lb. packed, according to size.

BUSINESS TERMS

CONDITIONS OF SALE.—We believe that all fruit trees, rose plants, etc., sold by us are of the description and kind specified by us at the time of sale, and are true to label; but owing to the practical impossibility in many cases of being certain of this, beyond refunding the original money paid for wrongly named goods or supplying others in their place, we, further, give no warranty, expressed or implied, as to their living, growth, description, quality or productiveness, and make all sales subject to these conditions. If the purchaser does not accept the goods sold to him on these terms, they are to be returned to us at once.

In forwarding you our Twenty-eighth Annual Catalogue and Price List, we tender our best thanks to all customers for their continued and increased support and kind recommendation, and hope to retain their confidence by straightforward and honest dealing. Our constant aim is to give the fullest value with each and every order given to us, and in the 27 years that we have traded we have worked up one of the largest Fruit Tree and Rose Nurseries in N.S. Wales, using little other advertisement than satisfied customers' voluntary recommendations.

CORRESPONDENCE to be addressed to **L. P. ROSEN & SON, EPPING, N.S. WALES**, as letters are sometimes delayed by being mis-sent to Victoria or Tasmania.

PRICES.—Prices throughout this Catalogue have been placed as low as possible consistent with first-class quality and true-to-name careful growing. We are unable to allow any discounts, and prices quoted are for nett cash within one month of receipt of invoice. Three months overdue accounts will be handed in for collection, unless otherwise agreed at time of sale.

PAYMENTS.—In order to cut overhead expenses and save book-keeping work, unknown customers are respectfully requested to remit with order, and for your own advantage please add cost of trainage. Remittance may be made by Cheque (if drawn on any bank outside the metropolitan area, should have exchange added), Money Orders and Postal Notes (payable at Epping). Please do not affix stamps on P.N., and keep a record of the numbers in case any are lost, for if numbers are known they are easily traced.

ORDERING INSTRUCTIONS.—To save possible errors, omissions and misunderstandings, please use Order Sheet in Catalogue. Write your address legibly, and give clear instructions as to route, for, if no instructions are received, we will despatch goods according to our best judgment. Orders should be written on separate sheets, not mixed with the remarks or instructions of a letter, as this often causes mistakes. Be sure and sign your name and give address; orders reach us lacking either or both. Ladies will assist us by prefixing Mrs. or Miss, as the case may be, in giving signatures on letters, etc.

FREIGHTS.—By passenger or mail train, parcels arrive much quicker than by goods train, and, although the cost is higher, in many cases it is advisable to have them sent by mail train, particularly evergreen trees, and when customer lives miles away from railway, as it is cheaper to pay the extra freight than to make a special trip for them; but two rates prevail, prepaid and to pay. The latter is the highest, hence in remitting, enclose sufficient to cover cost of freight. Any surplus after pre-paying freight will be refunded with invoice, but if not sufficient, we will always, unless otherwise instructed, forward packages to pay, which costs 25 per cent. more.

PACKING is done with the utmost care, and is charged only at cost price. All orders accompanied with remittance are packed free, except where boxes and cases are used, which are always charged for at cost price. Packages are delivered at Epping Station, and all goods then travel at consignee's risk and expense.

EXECUTING ORDERS.—All orders are executed and despatched promptly within 24 hours of receipt, and when they are not desired immediately an acknowledgment will be posted giving as near as possible a list of articles which cannot be supplied, etc. All orders are advised or invoiced the same day as despatched and receipts given for moneys enclosed on printed form, so as to check possible errors in booking.

INQUIRERS for trees should definitely state if we are to hold the goods pending reply to inquiry and receipt of order, as no trees are held on order unless we are asked to do so. Intending Customers have at times been disappointed by writing, "What can you do the enclosed list for?"—and weeks later expected us to have kept them. We will be pleased to give any information by letter or otherwise to intending planters. Exact quotation will be given (if so required) for any order, packed, and freight paid to any railway station in N.S. Wales.

BOOKED ORDERS.—Make your selection of Fruit Trees, Roses, etc., upon receipt of catalogue and then book your order, giving, if possible, the date order is to be despatched. It costs no more to order early.

We are prepared at all times to propagate trees for customers from seedlings, or selected strains, as keen observers will often notice that some trees bear better than others, and when extensive planting is contemplated, we would advise propagating from such trees in preference, such trees to be the exclusive property of the grower for whom they are propagated. For Autumn budding during February, March and April, cut firm, well ripened wood of current season's growth, and cut leaves off. For grafting cut dormant growth in late July.

SUBSTITUTION.—To avoid disappointment, please state, when ordering, if you allow substitutes or not, for as the season advances, some sorts might be sold out, and if the varieties asked for are exhausted, others equally as good and ripening the same season will be substituted when it can be done, unless ordered to the contrary.

TELEPHONE ORDERS.—Owing to difficulty in hearing at times over the 'phone we accept no responsibility for any errors occurring in taking down orders, unless confirmed by letter, and unknown customers' telephone orders will not be executed without full postal address or satisfactory references. Business 'phone, Epping 96; after hours, ring Epping 96 for Mr. C. W. Rosen, and Epping 58 for Mr. J. W. E. Larsen.

INTER-STATE ORDERS.—We would be glad if Inter-State customers would post their orders to arrive not later than Monday, as the Inspector only calls every Tuesday, and all Inter-State orders have to be fumigated and certificate accompany them.

DELAYED CONSIGNMENTS.—It sometimes happens that parcels get delayed in transit. In such cases it is best to communicate direct with the Railway Traffic Manager, Challis House, Sydney; as well as notifying us; and if parcels are so long in transit that there is a doubt that plants are alive, delivery need not be taken, or the parcel could be opened in the station master's presence, to see if they are in a fit state to be taken delivery of. But in all cases it is the buyer who has to make a claim. We, as senders, cannot do so. **INTER-STATE** parcels may be delayed at the border town, or often at the Department of Agriculture in the capitals. Communicate with either for speedier results, as well as notifying us.

REPLACEMENTS.—We cannot undertake to replace, gratis, plants that may fail, as we do not consider either success or failure to be under our control once plants are despatched, unsuccess being sometimes attributed to the quality of the plants rather than to what is often its real cause, improper planting, unfavorable weather, or want of water and after care; but as a plant is a living, breathing thing, we have no power to give any assurance or promise as to life; all we can do is to supply a sound and healthy plant. There are many causes for death, some known and many unknown, but suitable weather, proper planting, and reasonable after care will reduce the possibility of a failure to a minimum. Where faults are ours we will invariably make good.

AGED TREES.—We are sometimes asked for two, three-year, or older trees as many regard these as better than a well-grown yearling; but all our large buyers, those who make a living in fruitgrowing, prefer the yearling to an older tree, as it transplants better, takes easier, makes a better start, and can be pruned to any desired shaped tree, and at the end of one or two years is quite the equal of any older tree planted at the same time, and in most cases better, so there is little or no gain in planting the older trees. A yearling tree is one which has made one season's growth from the bud or graft.

ONLY THE BEST.—We are often asked to send only the best varieties in fruit trees, and roses, but this is largely a matter of tastes and localities, as what pleases one does not suit another, but where selection is left to us we will always send good, reliable kinds likely to give the fullest satisfaction.

MISTAKES.—We exercise the greatest possible care in filling orders to send out goods absolutely true to label, and all buds, etc., are cut personally by ourselves in order to reduce possible mistakes to a minimum, yet, in the busy packing season, when we are working at high pressure, errors sometimes occur, and we hold ourselves prepared to promptly rectify any errors as far as possible. Stock should be carefully counted upon receipt; if not correct, please write us at once, stating what the trouble is, so that we may at once rectify the mistake or give a satisfactory explanation. As it is beyond our power to control the seasons, or treatment of stock after despatching, we cannot pay attention to complaints unless promptly made.

NEW VARIETIES.—We constantly import new varieties in fruit trees, roses, etc., such as should be of superior merit, from the most reliable sources in other parts of the world, and the descriptions of these are taken from the raisers' catalogues, not ours, as we cannot test and fruit new varieties until we have had them three or four years, or even longer, and in many cases we are unable to fruit them in Epping, as the climatic conditions are not suitable for several kinds; hence we would take it as a favor if customers more favorably situated would furnish us with a report on any new or comparatively unknown variety that they may have fruited, as this would greatly help us in recommending or discarding same as the case may be, for in both fruit trees and roses it happens that those most highly recommended in other climes and places do not come up to expectations with us, hence we always try to avoid giving too glowing descriptions.

PRUNING.—Unless we are specially asked to do so, all fruit trees are sent out unpruned, as methods and ideas of pruning vary considerably according to different climates, and most customers prefer to prune according to their own ideas. If pruning is required, please mark plainly on order sheets.

FUMIGATION.—All Deciduous Fruit Trees are fumigated before sending out, and all interstate and Irrigation Area orders must be specially fumigated before despatch, but if customers require it, we are prepared at all times to specially fumigate before despatch.

BUSINESS HOURS:—Week-days, 7.30 to 5; Saturdays, 7.30 to 11.30. Closed on Sundays. Nurseries are close to Epping Station (7 minutes). The Nurseries contain about 25 acres under young stock, in various stages of development. Inspection cordially invited. The best months to inspect the roses are March to May.

Our Trees, Roses, etc., are hardy and well-rooted, and likely to give every reasonable satisfaction. Any varieties not listed we are willing to procure, if available.

Not less than six at dozen rates, 50 at 100 rates, unless otherwise priced, but special quotations will be furnished on mentioning quantities required.

We decline to deliver at erroneous prices figuring in this catalogue that may have escaped our notice.

This Catalogue cancels all previous terms, conditions and prices.

FRUIT TREES

PLANTING TIME.—All deciduous Fruit Trees should be planted during May to August, inclusive. June and July are generally regarded as the best months. Early planted trees get established before the dry summer sets in. Time of planting should be judged a good deal by your own locality, as in some districts spring is later than in others. Our district being comparatively early, it is advisable for planters in districts where spring is late to receive the trees early, and heel in till required, as they are more likely to remain dormant that way. Trees can be planted earlier or later if so desired, but there is no advantage and nothing gained in planting out of season.

RIPENING.—The times of ripening of stone fruits described is, in the majority of cases, as naturally ripening on the tree in the Cumberland coastal district, but this varies considerably according to soil, aspect, elevation, moisture, and often varies in the same orchard from year to year, depending on variable climatic conditions. Cold and inland districts are usually about three weeks later with early to mid-season fruits, but with later kinds the margin is not so wide.

FRUITING.—The age trees begin to bear is variable, and largely depends on cultivation, pruning, and conditions prevailing after planting. Trees growing extremely well in early stages will not bear as early as trees that get checked in their growth, and when trees are neglected and left unpruned from the beginning they will often fruit early, but rarely develop into a tree capable of bearing a decent crop. Sizes of any fruits given are average size grown under normal conditions, as fruit on young trees is generally much larger and coarser than on older ones. Approximate fruiting ages given under each variety. Extra early fruiting is not desirable, as it is at the expense of future crops.

WEIGHT.—Fruits on light soils, where potash constituents dominate, are usually of good, even, commercial size, their skin being a good color and heavy in proportion to their size. On black soils, containing a high percentage of humus and nitrogen, fruits tend to be larger, thicker in skin, not as good color, and lighter in weight proportionately.

GROWTH.—Most fruits described are vigorous growers, unless especially described otherwise.

APPLES

All Worked on North Spy Stock; commence bearing 4th-7th year after planting.
1/9 each, 18/- per dozen, where not otherwise priced.

Available on Carrington Stock, a limited number of Delicious, Granny Smith, and Jonathan.

All our Apples are worked on blight-proof stocks (Northern Spy), thereby preventing the Woolly Aphis from attacking the roots; and when the roots are clean, the heads may then, with less difficulty, be kept free from this destrutice disease, but the blight-proof stock does not prevent the insect from attacking the tree above the budded or grafted place. Apples grown in warm climates are not as good keeping as those grown in colder climates, and early kinds should not be stored, as they soon go floury. For guidance in Apple culture see Bulletin 92, issued by the Department of Agriculture, Sydney.

Allsopp's Early.—Medium, green, floury, prolific, the earliest cooker for coast, blight proof.

Ben Davis.—Large, yellow with stripes, very late keeper, heavy bearer.

Bismarck.—Very large and showy, early and heavy cropper, mid-season.

Black Ben Davis.—Large, dark red, good keeper, heavy bearer, late.

Brownlee's Russett.—Large, for cooking or dessert, prolific, late.

Carrington Red.—Medium, bright scarlet, varies considerably in color, often striped, and appears to be untrue to label, prolific, blight-proof, the earliest for the coastal districts.

Carrington Striped.—Large, yellow striped red, good bearer, fair quality, early. Striped trees are occasionally found among red ones.

Cleopatra.—Large, yellow, conical, heavy heavy cropper, good keeper, fine for cooking or dessert, late, subject to bitter-pit in badly drained positions and soils.

Climax.—Medium, yellow streaked red, flesh yellow, crisp, juicy, early, good bearer, blight-proof.

Commerce.—Medium, red, blue bloom, quality fair, heavy cropper, almost blight-proof, late.

Cowell.—Medium, yellow, red stripes, good quality, prolific, early.

Delicious.—Medium large, color streaky and irregular on different soils, fine dessert, heavy bearer, late mid-season.

Dunn's (Munro's Favorite).—Very large, yellow with red cheeks, heavy bearer good keeper, cold climates only, late.

- Fameuse (Lady in Snow—Fanny).**—Medium, good color, snow-white flesh, splendid dessert, mid-season to late, aged trees bear well.
- French Crab.**—Large green cooking, suits cold climate, keeps well, very late.
- Frimley.**—Large, dark red, hard and crisp, good keeper and bearer, very late, promising.
- Golden Delicious.**—Large fruits, golden yellow, firm flesh, good keeper, a yellow form of the well known Delicious. 3/6.
- Gorgeous (Crab).**—Small fruit, very pretty color, good bearer.
- Granny Mack.**—A new apple, well recommended as a cross between Granny Smith and McIntosh. 3/6.
- Granny Smith.**—Large, greenish yellow, juicy; generally regarded as a cooker, but if stored becomes a first-class dessert fruit one of the best late apples. The leading apple of N.S. Wales.
- Granny Thompson.**—Large, yellow striped red, heavy bearer, fair quality, mid-season.
- Gravenstein (Carpenter).**—Medium to large, yellow striped red, crisp and delicious, falls easily, dessert, fairly early, moderate grower.
- Grimes' Golden.**—Large, golden yellow with grey dots, roundish, flesh yellow, fine dessert, good keeper, very late.
- Irish Peach.**—Medium, red streaked, flattish, good bearer, blight-proof, dessert, a good early for cold highlands.
- Jonathan.**—Large, yellow, overlaid red, flesh crisp and juicy, good bearer, a favorite everywhere, mid-season.
- King David.**—Medium to large, dark red, quality good, early and heavy cropper, blights badly, mid-season.
- Kirks.**—Large, crisp, somewhat tart, bright red, fair carrier, ripening early for Christmas market.
- Lalla.**—A crimson sport of Delicious, raised by Mr. F. Walker, of Launceston; identical in every way with the Delicious, except color, which is bright crimson all over. Stock limited. 5/- each.
- London Pippin (Five Crown).**—Large, flattish, yellow, heavy bearer, first-class dessert apple, for cold climates only, almost blight-proof, late.
- Lord Nelson.**—Extra large, yellow with red, cooking, prefers loamy soil, aged trees bear well, early.
- McIntosh.**—Large, yellow, flushed red, heavy bloom, excellent quality, soft white flesh, falls easily, a fine dessert apple, mid-season.
- Mobbs' Royal.**—Very large, green, cooking and baking, good bearer, early.
- Northern Spy.**—Large, yellow striped red, juicy and aromatic, keeps well, blight-proof, for cold climates only, aged trees bear well, late.
- Paragon.**—Large, dark red, flesh firm, yellow, good quality, late, promising.
- Rome Beauty.**—Large, yellow striped red, good keeper, hard and crisp, blights badly at times, one of the best, late.
- Ruby Gem.**—Large, bright red, flesh white, falls easily, blight-proof, early, good bearer.
- Scarlet Nonpareil.**—Medium, yellow streaked red, good quality, prolific, cold humid climates only, very late.
- Sharp's Late.**—Large, bright red on yellow, blight-proof, flesh yellow, firm, good bearer.
- Stayman.**—Large, yellow flushed red, good keeping dessert, fine quality, good bearer, late.
- Sturmer.**—Large, yellow overlaid dull red, prolific bearer, long keeper, cold moist climates only, late.
- Tasma (Democrat).**—Large, dark crimson, flattish, grand keeper, coarse quality, heavy cropper, very late.
- Trivett.**—Medium, yellow striped red, crisp, white flesh, heavy bearer, requires thinning, mid-season.
- Twenty-ounce.**—Very large, greenish yellow, streaked red, cooking, good bearer, blight-proof, mid-season.
- Vanderpool.**—Large, yellow, red cheek, fine flavor, good keeper, late.
- Williams Favorite.**—Large, good color, blight-proof, flattish, dessert, good bearer, moderate grower, early.
- Willie Sharp.**—Medium, yellow, good dessert, early, blight-proof, keeps well for an early, fine flavor.
- Wilson Red June.**—Large, deep red, keeps well, early and heavy bearer, poor grower, early.
- Yates.**—Medium small, striped and mottled red, dessert, good keeper, prolific, for cold climates only, very late; size can be improved by irrigation.

APRICOTS

Worked on Mariana Plum Stocks; commence bearing 4th-6th year after planting.
1/9 each, 18/- per dozen, where not otherwise priced.

Available on Peach Stock—Camden, Hemskirk, Moorpark, Newcastle, Oullins.

Require well-drained and high situation; shaley and gravelly subsoil often produce the best fruit. Unlike other stone fruits, Apricots are spur bearers, hence seldom bear young, mostly growing into a large tree before showing much spur bearing wood.

Camden Superb.—Large, pale yellow, oblong, good bearer, requires high situation, early.
Campbellfield.—Large, orange yellow, good bearer, mid-season.
Cattell Early.—Large, yellow, fair bearer.
Colorado.—Large, golden yellow, good quality, good bearer, late.
Hemskirk.—Very large, yellow, good bearer, late.
Mansfield's.—Large, yellow, fine flavor, good bearer, mid-season.
Moorpark.—Large, yellow, red cheek, good quality, fine carrier, good bearer, mid-season.
Newcastle.—Medium, yellow, red cheek, good quality, early and heavy bearer, best early.

Oullin's Early.—Large, golden yellow, roundish, rich flavor, good bearer.
Pineapple.—Large, roundish, bright yellow, good bearer, mid-season.
Royal.—Large, yellow, red cheek, good bearer, mid-season.
Shipley Blenheim.—Large, deep yellow, good bearer, and drying and carrying, mid-season.
Tilton.—Large, golden yellow, good drying, prolific, mid-season.
Trevatt.—Large, yellow, rich, good cropper and dryer, mid-season.
Warwick.—Large, yellow, flesh firm, sugary, fair bearer, early.
Wenatchee.—Large, golden yellow, ripens evenly, fine shipper, heavy bearer, mid-season.

CHERRIES.

All Worked on Seedling Mazzard Stock; commence bearing 5th-8th year after planting.

1/3 Each, 18/- per Dozen, where not otherwise priced.

Available on Kentish Stocks, Bigg Common, Bigg Napoleon, Burgdorffs, Calif, Advance Eagles, E. P. Guinge, Early Lyons, Florence, Noble, St. Margaret, Werder's.

Require a cold climate, deep soil, with good natural drainage, and in N. S. Wales an elevation of at least 1500 feet. For those growing Cherries largely for market, it is essential to choose good, firm cherries of large size, such as St. Margaret, Ramen Olivia, Florence, Big Napoleon, and Early Lyons. The latter is the finest of the early sorts, and largely planted, although it is a shade tender to spring frost and rain.

Abundance.—Large, bright crimson, sweet, firm flesh, heavy cropper, late.
Bedford Prolific.—Large, brownish black, great cropper, mid-season.
Belle d'Orleans.—Medium, pale red, good cropper, very early.
Biggarreau Common (White Heart).—Large, pale red, prolific, early.
Biggarreau Napoleon.—Large, bright red, flesh firm, good late sort.
Bing.—Large, dark black, fair bearer, late.
Black Heart.—Large, black, shy bearer, early.
Black Republican.—Large, black, firm flesh, prolific, late.
Black Tartarian.—Large, black, prolific, mid-season.
Bleeding Heart.—Large, dark red, fine quality, red flesh, good cropper, mid-season.
Burbank.—Large, crimson, firm flesh, heavy bearer, fine quality, very early.
Burgdorff's.—Large, dark red, good bearer, early.
Californian Advance.—Medium, purple, good bearer, very early.
Eagles.—Medium, blackish, good bearer, early.

Early Lyons.—Large, black, firm flesh, pendulous habit, largely planted for market, most profitable of the early sorts.
Early Rivers.—Large, black, good bearer, very early.
Early Purple Guigne.—Medium, black, prolific, very early.
Florence.—Large, bright red, good bearer, one of the best for shipping, late.
Guigne D'Annonay.—Large, black, good bearer, early.
Knight's.—Large, black, good flavor, heavy cropper, early.
May Duke.—Medium, brownish black, good bearer, early.
Noble.—Large, blackish crimson, flesh firm and sweet, very late.
Oregon.—Large, reddish purple, flesh firm, rich, good bearer, late.
Precoce de Boppard.—Large, brownish red, juicy, good bearer, very early.
Ramen Oliva.—Large, dark red, flesh firm; resembles, but more upright grower than Early Lyons, early.
St. Margaret.—Very large, black, flesh firm, one of the best for market, late.
Werder's.—Large, shining black, productive, early.

NECTARINES.

Worked on Seedling Peach Stock; commence bearing 1st-3rd year after planting.
1/9 Each, 18/- per Dozen, where not otherwise priced.

Require similar soil and treatment to the Peach, to which they are closely allied, but are more tender to Fungus disease and Brown Rot, though varieties with highly colored fruits seem to resist the Brown Rot better than others.

Albert Victor.—Large, bright red, good flavor and cropper, slip, mid-season.

Ben's Pick.—Large, good color, fine flavor, slip, good bearer, mid-season.

Cardinal.—Medium large, bright red, good cropper, slip, very early.

Diamond Jubilee.—Large, bright scarlet, flesh white, prolific, mid-season, slip.

Elruge.—Medium, bright scarlet, prolific, good flavor, slip, early.

Early Rivers.—Large, slip, bright red, moderate grower, very early, good.

Fertile du Poitou.—Large, yellow striped red, flesh white, juicy, slip, mid-season.

Goldmine.—Very large, bright bronzy red, fine flavor, slip, sure bearer, mid-season, dries well. The leading Nectarine of Australia.

Lady Carrington.—Large, bright scarlet, good flavor, prolific bearer. the best cling, mid-season.

Lee's.—Large, streaked red, fair cropper, slip, mid-season.

Meek's Scarlet.—Large, bright scarlet, good flavor, heavy cropper, slip, mid-season.

New Boy.—Large, brilliant crimson, flesh juicy, good bearer, slip, mid-season.

River's Orange.—Medium, yellow, red cheek, fine flavor, good bearer, slip, the best yellow flesh, early.

Stanwick Seed.—Large, yellow striped red, good flavor, does not crack much, the best of the late slips.

W. C. Fripp.—Large, yellow with red, good bearer, cling, late.

Zealandia.—Large, yellow flushed red, good bearer, slip, mid-season.

PEACHES.

Worked on Seedling Peach Stock; commence bearing 1st-3rd year after planting.
1/9 Each, 18/- per Dozen, where not otherwise priced.

Thrive best in good, open loam, thoroughly drained, but will grow in almost any fairly well-drained soil. Early kinds are not suited for canning, as they go soft or mushy too quickly; late kinds being slower maturing have a tougher flesh which keeps well when canned.

Admiral Dewey.—Large, yellow, red cheek, yellow flesh, good flavor, blooms late, good bearer, ripe Christmas slip.

Alton.—Large, creamy, red cheek, flesh white, juicy, good bearer, slip, early.

Anzac.—Raised by A. Zerbe, Esq., Doncaster. Like a Briggs, but recommended as a sure cropper. Ripe in Victoria at Christmas.

Aunt Becky.—Large, bright crimson, white-fleshed, prolific, slip, early.

Bell's November.—Medium, yellow flushed red, prolific, blooms early, requires high situation, slip, very early.

Bell's Impr. (Lambton).—Large, yellow flushed red, good bearer, slip, early.

Blackburn.—Large, yellow, red cheek, yellow flesh, prolific, slip, ripens New Year.

Black Braddock.—An improved Braddock, larger, but not so prolific. We believe this identical with Braddock Improved.

Braddock.—Medium, red, crops heavily, slip, requires severe pruning and thinning early.

Braddock Imp.—Larger than Braddock, lighter in color, not so bitter, fair bearer.

Brigg's Red May.—Well known early kind, lately a shy cropper, semi-cling.

Carman.—Large, creamy with red cheek, white flesh, fine quality, slip, ripens Christmas, the best of its season.

Christmas Box.—Large, creamy, flushed red, white flesh, fine flavor, slip, ripening Christmas, fair bearer.

Devlin's Red.—Medium, dark red, white flesh, cling, prolific, requires hard pruning, early.

Discovery.—Medium, bright crimson, white flesh, ripens early December.

Duke of York.—Medium, bright crimson, white flesh, fair cropper, slip, early.

Early Crawford.—Large, yellow, red cheek, yellow flesh, slip, only profitable in deep, rich soil, mid-season.

Early Elberta.—Large, yellow, flushed crimson, yellow flesh, good cropper, slip, mid-season.

Early Rivers.—Large, pale yellow, white flesh, prolific, good for home use, slip.

Early Silver.—Large, good color, fine for home use, prolific, ripens early December, moderate grower.

- Edward VII.**—Medium, yellow, flushed red, blooms early, slip, sweet, requires high situation, extra early.
- Elberta.**—Large, yellow and red, yellow flesh, slip, good bearer, mid-season.
- Finlayson.**—Large, round, yellow, flushed red, yellow flesh, good bearer, late.
- Flat China (Button Peach).**—Medium, flat, greenish, tinted red, blooms early, slip, good bearer, thrives best in warm, humid climates, early.
- Globe.**—Large, yellow, red cheek, yellow flesh, firm, slip, late.
- Golden Queen.**—Medium, yellow to stone, heavy cropper, cling, a canner, compact growth, late.
- Goodman's Choice.**—Large, yellow, yellow flesh, good bearer, cling, a canner, late.
- Governor Rawson.**—Medium, white flushed red, slip, wants high situation, prolific, blooms early, extremely early.
- Greensboro.**—Large, bright red cheek, fair quality, prolific, slip, early.
- Hales' Early.**—Large, blush red, good flavor, slip, requires good soil to do well, early.
- Italian Cling.**—Very large, yellow, red cheek, flesh yellow, very late.
- Italian Slip.**—Very large, yellow, red cheek, yellow flesh, prolific, very late.
- June Elberta.**—Large, yellow, tinted red, good bearer, slip, the earliest yellow flesh peach, ripens early December.
- J. H. Hale.**—Very large, round, yellow, bright red cheek, yellow flesh, fine grained, good flavor and carrier, good bearer, slip, mid-season.
- Kia-ora.**—Large, yellow, red cheek, yellow flesh, slip, early, mid-season.
- La France.**—Medium, carmine, flesh white, juicy, prolific, early, slip.
- Late Crawford.**—Large, yellow, yellow flesh, productive, slip, late.
- La Vainqueur.**—Medium, cream tinted red, extra early, heavy bearer, slip.
- Mayflower.**—Large, bright red, good quality, ripens mid-November, semi-cling, late flowerer, shy or irregular bearer in most places.
- Marquis of Downshire.**—Large, round, greenish, dark red cheek, white flesh, good bearer, late.
- McDevitt's Cling.**—Very large, rich yellow, covered dark red, yellow flesh, late, good bearer.
- Mountain Rose.**—Large, bright red, white flesh, prolific, requires good soil, early.
- Paragon.**—Large, yellow, mottled red, yellow flesh, juicy, cling, mid-season.
- Peaks.**—Large, roundish,, deep yellow, red cheek; firm, yellow flesh, good canner, good bearer, cling, late.
- Pelora.**—Large, roundish, golden yellow skin; firm, yellow flesh; cling, good canner, good bearer, mid-season.
- Phillip's Cling.**—Large, yellow-fleshed, cling, regular cropper, a canner, late.
- Princess Royal.**—Large, round, creamy white, shaded red, white flesh, good bearer, cling, late.
- Pullar's Cling.**—Very large, yellow, red cheek, yellow flesh, a canner, late.
- Ray.**—Medium, white, red cheek, white flesh, good bearer, slip, ripens Xmas.
- Red Bird Cling.**—Large, bright red, shy bearer, the earliest cling.
- Reeve's Favorite.**—Large, yellow, with red, flesh yellow, red at the stone, slip, prolific, ripens before Elberta.
- Robert Stewart.**—Large, white, red cheek, white firm flesh, good flavor, cling, good bearer, mid-season.
- Rowe's Champion.**—Large, white flesh, slip, good color, ripens early January.
- Royal George Cling.**—Large, white, crimson cheek, flesh white, mid-season.
- Royal George.**—Large, white, red cheek, white flesh, fine quality, good bearer, slip, mid-season.
- Ruby Red.**—Large, bright red, flesh white, cling, heavy cropper, dwarfish growth, early.
- Selma Cling.**—Large, roundish, golden yellow, crimson cheek; firm, yellow flesh, a canner, good bearer, mid-season.
- Shanghai Seedling.**—Large, white, red cheek, white flesh, fine flavor, cling, heavy cropper, mid-season.
- Shanghai Slip.**—Large, white flesh, much like Shanghai seed, only a slip.
- Triumph.**—Large, yellow, covered with red, flesh yellow, excellent flavor, slip, good bearer, blooms late, inclined to be hairy, ripens before Christmas.
- Tuscan Cling.**—Large, yellow, red cheek, yellow flesh, a canner, mid-season.
- Watt's Early.**—Medium to large, creamy, flushed red, blooms early, good bearer, slip, ripens with Edward VII., requires heavy pruning and thinning, when irrigated is a fine peach.
- Wiggins.**—Large, oblong, creamy, red cheek, white flesh, fine quality, slip, heavy cropper, ripens New Year, a good market kind.

PEARS

Worked on Seedling Pear Stock; commence bearing 4th-8th year after planting.

1/9 each, 18/- per dozen, where not otherwise priced.

Thrive best in deep, moist soil, with sheltered position. Plant deeper than other trees. Slower in fruiting than most other trees. Pears grown in warmer climates are

not nearly as good of keeping as those grown in colder climates, and most early kinds will not keep, often going rotten inside. China and Keiffer are the most suitable kinds for breakwind purposes. For full guidance in Pear Culture see Bulletin 92, issued by the Department of Agriculture.

- Baron de Mello.**—Medium, skin russet, flesh yellow and buttery, good bearer, fine pollinator for Packham's Triumph, mid-season.
- Bergamot (Bailey's).**—Medium, greenish russet, good flavor, keeps well, medium, late.
- Bergamot (Gansel's).**—Large, greenish russet, keeps well, melting, splendid flavor, late.
- Beurre Bosc.**—Large, very long, rich russet, finest quality, fine keeper, aged trees bear well, moderate grower, late.
- Beurre Capiaumont.**—Medium, yellow, red cheek, flesh firm, keeps well, fair quality, heavy cropper, mid-season.
- China.**—Large, yellow, prolific, good for kitchen and preserving, mid-season.
- Clapp's.**—Very large, yellow, red cheek, fine quality, falls easily in windy positions, good market sort, early.
- Doyenne du Comice.**—Medium, greenish yellow, fine flavor, prolific, dwarf, late.
- Fertility.**—Medium, yellow russety color, prolific, early, mid-season.
- Glou Morceau.**—Large, obovate, yellow, flesh buttery, juicy, good dessert, late.
- Howell.**—Medium, light waxen yellow, good quality, heavy bearer, keeps well, good market sort, early mid-season.
- Josephine de Malines.**—Medium, greenish yellow, fine flavor, very juicy, good keeper, very late, aged trees bear well.
- Koonce.**—Medium, golden yellow, red cheek, heavy bearer, very early.
- Keiffer (China Hyb.).**—Large, roundish oval, yellow, prolific bearer, good canner and fair quality if stored, late.
- Le Comte (China Hyb.).**—Large, bell-shaped, yellow, flesh fine-grained, fair quality, prolific, mid-season.
- Napoleon.**—Large, greenish, red cheek, good keeper, good bearer, cooking and dessert, very late.
- Packham's Triumph.**—Large, greenish yellow, irregular shape and size, fine quality, good keeper, good bearer, one of the best dessert pears, late.
- Packham's late.**—Large, greenish yellow, good bearer, late.
- Uvedale's St. Germain (Long Baker).**—Extra large, green, good cooker, ancient trees bear well, late.
- Williams' (Bartlett).**—Large, yellow, red cheek, fine quality, musky flavor heavy bearer, dries and cans well, one of the best and widest planted, mid-season.
- Winter Bartlett.**—Large, greenish yellow, irregular shape, coarse grained, good bearer, late.
- Winter Cole.**—Medium, greenish yellow, juicy, good bearer and keeper, late.
- Winter Nelis.**—Medium, russet, good bearer and keeper, one of the finest flavored dessert pears, late.

EUROPEAN PLUMS

Worked on Mariana Plum Stock; commence bearing 3rd-5th year after planting. Available on Peach Stock are: A. Burdett, Diamond, Excelsior, Grand Duke, Lutherborough, President.

1/9 each, 18/- per dozen, where not otherwise priced.

Most of the European varieties only come to perfection in mountain districts, or where the winter is cold. Those marked with an asterisk can also be grown commercially on the coastal area. Require little attention, and can endure more hardship as to soil and situation than most fruits. See also Prunes, all of which are first-class table fruits as well. For full guidance in Plum culture, see Bulletin 86, issued by the Department of Agriculture.

- ***Angelina Burdett.**—Large, purple, fine dessert, slip, irregular bearer in coastal belt, one of the best, mid-season.
- ***Black Cluster (Bully).**—Medium, blackish purple, slip, splendid jam sort, aged trees bear well, early.
- ***Cherry Plum (Red American).**—Medium, bright red, slip, extra early.
- Coe's Golden Drop.**—Large, yellow, rich, slip, for cold districts only, late.
- ***Diamond.**—Extra large, oval, almost black, heavy bloom, tart, slip, splendid cropper, mid-season.
- ***Early Evans.**—Medium, blackish purple, slip, sometimes shy, very early.
- Early Orleans.**—Large, purple, sweet, slip, splits easily in wet, mid-season.
- ***Excelsior (Jenkins).**—Large, roundish, purple, heavy bloom, good flavor, prolific, slip, ripe mid-January, good.
- Giant.**—Enormous size, red, firm flesh, yellow, slip, good bearer, fine carrier, poor grower, mid-season.
- Grand Duke.**—Very large, blackish purple, fine flavor, slip, prolific, one of the best in cold climates, late.

Greengage.—Medium, green, flavor unsurpassed, slip, requires cold climates to bear well, mid-season.

King of the Damsons.—Medium, blue, slip, frost plum, moderate grower, late.

***Lutherborough.**—Medium, black, slip, heavy bearer, good for jam, unusual flavor, mid-season.

Merryweather (Damson).—Medium, blue, Damson flavor, slip, good bearer, late.

Missouri Greengage.—Medium, green, highest flavor, good bearer, slip, mid-season.

Monarch.—Large, roundish, oval, purplish blue, slip, good bearer, late.

Pond's.—Large, red, slip, good cropper in suitable locality, an irregular bearer and uncertain grower, mid-season, often dies back.

***President.**—Large, oblong, purple with white dots, heavy bloom, flesh firm, good bearer, slip, one of the best for cold climates, very late.

Thiele.—Medium, red, good quality, fine keeper, poor grower, prolific, late.

Tibbitt's.—Medium, purple, sure bearer, rather tart, slip, extremely early.

PRUNE PLUMS

Worked on Mariana Plum Stock; commence bearing 4th-7th year after planting. available on Myrobolam Stock, D'Agen, Robe, and Sugar

1/9 Each, 18/- per Dozen, where not otherwise priced.

Prune is simply a French name for Plum, but the expression is now mostly applied to those Plums used for commercial drying. The qualities that make for a good prune are a dry, meaty flesh, high percentage of sugar, and ability to dry with the stone in without fermenting. Some of those not called prune can be used for drying, but Robe de Sergeant and Prune d'Agen are the two highest grade commercial varieties.

Golden.—Large, roundish oval, golden, skin thin, slip, late.

***Imperial d'Eppinay (Imperial).**—Large, juicy, purple, slip, good bearer, a fine table plum, mid-season.

Pacific.—Large, purple maroon, slip, good bearer, mid-season.

Pond's (Hungarian Prune).—See Plums.

Prune d'Agen (French).—Medium, purple, very sweet, good cropper, dries easily, mid-season, slip.

Robe de Sergeant.—Medium, purple, very sweet, slip, heavy cropper, splits easily in wet, mid-season.

Silver.—Large, yellow, very sweet, slip, good bearer, late.

Splendour.—Medium, reddish purple, heavy bloom, firm, sugary, slip, prolific, early.

Sugar.—Medium, purple, extra sweet, slip, good bearer, early mid-season.

Tragedy.—Large, purple, juicy and sugary, a fine table plum, early slip.

JAPANESE and HYBRID PLUMS.

Worked on Mariana Plum Stock; commence bearing 1st-4th year after planting.

1/9 Each, 18/- per Dozen, where not otherwise priced.

On Peach Stocks available, Santa Rosa, Wilson, Satsuma, Early Gem, and Narrabeen.

This type is very popular in localities unsuited for the profitable production of many of the European varieties. They are prolific and early bearers, handsome in appearance, mostly of a flavor peculiarly their own. The tendency in some varieties to sun scald is much more pronounced in humid climates. The modern varieties are a great advance on the older kinds and are now largely in favor both for fresh fruit, and jam making.

Balleana.—Large, yellow and crimson, flesh, firm, slip, prolific, late.

Billington.—Medium, firm, meaty, good shipper, prolific, has no bitterness, light red flush, ripens Christmas.

Blood (Upright).—Large, blackish crimson, heart-shaped, blood color, slip, heavy bearer, mid-season.

Blood (Satsuma).—Large, flat, red, heavy bloom, flesh red, semi-cling, weeping growth, good bearer, a favorite, late.

Burbank.—Large, cherry red, lilac bloom, firm flesh, yellow, great cropper, slip, requires good soil, early.

Chalco.—Large, flattish, reddish purple, firm flesh, fine flavor, slip, fair bearer, mid-season.

Climax.—Very large, bright crimson, good flavor, slip, sometimes shy, ripens Christmas, splits easily in wet.

Delicious.—Large, round, purple, heavy bloom, juicy, slip, mid-season.

Discovery.—Large, crimson, good quality, flesh rosy crimson and firm, cling, good bearer, ripe mid-December.

Doris.—Medium, black purple, firm yellow flesh, slip, good bearer, good for jam, late, colors early.

Early Gem.—Small, dark crimson, good carrier, fair bearer, extra early.

Early Jewel.—Medium, bright red, juicy, fine flavor, slip, irregular bearer, very early.

Early Satsuma (or Satsuma Seed).—Medium, dull crimson, flesh crimson, cling, good bearer, rather tart, ripens early December.

Export.—Medium, dull crimson, sweet flavor, blood-red flesh, cling, mid-season, good bearer, roundish.

Kelsey (Purple Monster).—Extra large, heart-shaped, skin greenish, turning purplish, fine flavor, slip, heavy bearer, scalds easily on coast, good carrier, late, good inland.

Narrabeen.—Large, round, flattish, skin reddish with yellow dots, flesh yellow, juicy, sugary, small stone, good cropper. Ripens end January.

October Purple.—Large, purple, flesh yellow, very sweet, prolific, slip, scalds easily on coast, mid-season.

Pasha.—Large, oval, red cheek, heavy bearer, flesh yellow, sweet, slip, early.

Paterson Early.—Medium, bright crimson, firm yellow flesh, good bearer, early.

Paterson Late.—Medium, bright red, round, slip, good bearer, ripens late March.

Purple King.—Large, roundish, skin dark crimson, heavy bloom, flesh light red, good flavor, late.

Santa Rosa.—Large, oval, purplish crimson, heavy bloom, flesh light red, good flavor, slip, good cropper, ripens Xmas, upright grower, one of the best.

Shiro.—Medium large, amber yellow, slip, fine quality, good carrier, good for home use and jam, prolific, early.

Sultan.—Large, oval, dark crimson, flesh crimson, firm, slip, prolific, early.

Victory.—Medium, heart-shaped, dark crimson, blood-red flesh, good flavor, cling, mid-season, good bearer.

Wickson.—Very large, heart-shaped, yellow, red cheek, slip, prolific, good for home use, ripens end of January.

Wilson.—Medium large, bright crimson, flesh yellow, grand shipper, slip, ripens last week November. The best early.

Wright's Gigantic.—Large, reddish purple, yellow flesh, slip, prolific, upright grower, late.

Wright's Prolific.—Large, crimson, flesh red, firm, slip, heavy bearer, mid-season.

PERSIMMONS.

Worked on Seedling Persimmon Stocks; commence bearing 2nd-3rd year after planting.

2/- Each; 21/- per Doz., where not otherwise priced.

Will do in most soils, but thrive best in low, moist situations; the deeper and richer the better. Not suited for localities subject to severe late spring frosts. Can be pruned hard every year as they bear on the new growth each season. Late kinds color early, and are best left on tree till late in Autumn, for, if picked too soon do not develop their best flavor. Newly planted trees will do much better if watered liberally the first year or two and planted deep and firm. The dried fruits are somewhere between figs and dates in flavor and quality. Trees should not be planted too near a house, as often when flowering and setting fruit an offensive odour is prevalent.

Costata.—Medium, conical, salmon yellow, flesh light yellow, almost seedless, good bearer, very late. 2/6.

Delicious.—Large, yellow, flattish, good bearer, fine flavor, late. 2/6.

Dia Dia Maru.—Large, rather flat, deep orange, seedless, irregular bearer, late.

Gailey.—Small, oblate conical, good flavor, heavy bearer, dull red, flesh dark. Used in Florida for pollinating.

Gorgeous.—Large, good quality, good bearer, good autumn foliage.

Hayakume.—Very large, round, vermilion, flesh brownish, rich, late.

Haycheya.—Very large, heart-shaped, vermilion, yellow flesh, fine flavor, irregular bearer, early.

Kingcot.—Very large, roundish, yellow, seedless, prolific, mid-season.

Kurokumo.—Large, almost round, yellow, good cropper, late.

Large Flat.—Large, flattish, yellow, bears well, late.

Myotan.—Large, yellow, round, fine flavor, good bearer, late. 2/6.

Nightingale.—Medium, heart-shaped, yellow flesh, seedless, prolific, suited for warm, humid climates.

Nitaru.—Large, square, flattish, yellowish red, irregular bearer, late.

Okame.—Large, oblate, dark red, yellow flesh, fine quality, few seeds, prolific.

Ormond.—Medium, conical, deep red, tough skin, flesh orange, meaty, good quality, very late.

Tamopan.—Large, rather flat, with a constriction about the middle, golden red, tough skin, seedless. 2/6.

Tenanaschi (Seedless).—Large, heart-shaped, yellowish red, prolific, the earliest, and one of the best.

Triumph.—Medium, yellowish red, flattish, flesh yellow, fine quality, prolific, late.

Tsuno Marghari.—Medium, deep yellow, peculiar shape, rich flavor, good bearer, fine autumn foliage, late.

Tsuro Gaki.—Medium, long, yellow, fine flavor, seedless, mid-season.

Wright's Prolific.—Medium, yellow, good quality, prolific bearer.

Yeddo Ischi.—Large, round, vermilion, good flavor, very late.

Yemon (Cross Bun).—Large, rather flat, yellow, flesh orange, seedless, good bearer, the best market sort, seldom affected by fruit fly, very late.

Zenji Maru.—Medium, yellowish red, egg-shaped, flesh brown, many seeds, sweet, not a market sort, can be eaten when quite hard, mid-season.

FIGS

All grown from cuttings off bearing trees.

Commence bearing 1st-3rd year after planting.

1/9 each, 18/- per dozen, where not otherwise priced.

Under suitable conditions will bear two or more crops a year. Thrive best in sandy, loamy, rocky soil, where roots can reach water; in black soils on clay subsoils they do well, but fruit is not so sugary. Require little pruning beyond shaping and thinning out where branches are too thick and dense. In frostless regions fruits will often develop through the winter and ripen in the spring.

Blue Province.—Medium, bluish purple, very prolific, strong grower, unusual flavor.

Black Genoa.—Very large, purplish black, flesh red, luscious, good.

Brown Turkey.—Large, tawny black, luscious, productive, good.

Celeste.—Medium, greenish yellow, sweet, good for warm humid climates.

St. Domerque.—Medium, purplish black, flesh dark red, prolific.

White Adriatic.—Medium, brownish green, thin skin, prolific, fair grower.

White Genoa.—Medium, greenish yellow, good bearer, moderate grower.

Yellow Ischia.—Medium, greenish yellow, very sweet, prolific, the so-called Sugar Fig.

LOQUATS

Worked on Seedling Loquat Stock commence bearing 2nd-4th year after planting. 2/- each, 21/- per dozen, where not otherwise priced.

Will grow in almost any soil, and make a profitable, evergreen breakwind, in suitable districts. The safest time to plant is late autumn, preferably when the weather is dull or raining, as they are very sensitive to drying winds after transplanting; but, once established, are very hardy. Fruits ripen in spring, and require little or no pruning, but, if choicest fruit is desired, it will be necessary when heavy crops have set to either thin each individual bunch down to half the number, or else cut a number of bunches out altogether. The thinning of individual bunches will give the finest quality and best size.

Champagne.—Raised in California, large yellow, good flavor, good bearer. 3/6.

Boasley's.—Large, yellow, fleshy, reliable cropper, spreading grower, mid-season.

Californian Advance.—Large, golden yellow, productive, late.

Chatsworth.—Very large, yellow, fleshy, good grower and cropper, late.

Early Red.—Medium, yellow, good flavor early and good bearer. 3/6.

Gigantic.—Very large, yellow, good bearer, strong grower, 3/6.

Golden Shoreland.—Large, golden yellow, good bearer, mid-season.

Heard's.—Extra large, yellow, best market sort in N.S.W., mid-season.

Hunter.—Large, yellow, seedling from Heard's, and more regular bearer. 3/-.

Japanese.—Resembles Heard's, but fruit shorter and stouter, rather tart, late.

Sewell's Enormity.—Large size, yellow, good bearer, moderate grower, late.

Tanaka.—Large, pale yellow, good bearer, late. 3/6.

Thales.—Raised in California, large, yellow, good bearer, very late. 3/6.

Thames Prize.—Large, yellow, fleshy, good quality, good bearer, late.

MEDLARS

Worked on Quince Stocks commence bearing 2nd-3rd year after planting.

2/- each, 21/- per dozen, where not otherwise priced.

Thrive best where there is a cold winter, but will grow almost anywhere; fruit should be picked when hard, and kept in a cool place to soften.

- Common.**—Medium, round, brownish, good bearer.
Geant.—Large, round, brown, good flavor, heavy bearer.
Gross Fruits.—Large, round, brown, fine flavor, good bearer.
Monstrous (Dutch).—Large, round, brown, good bearer, fair flavor.
Nottingham.—Medium, flattish, brown, good bearer, fine flavor.
Royal.—Medium, brown, fine flavor, very prolific.

MULBERRIES

Commence bearing 1st-4th year after planting.

2/- each, 21/- per dozen, where not otherwise priced.

Will grow anywhere, but thrive best where roots can reach plenty of moisture.

- Abundance.**—Long, slender, glossy black, tart, prolific, strong grower.
Black English.—Large, black, very sweet, requires a cold or dry climate to do very well, very subject to black spot on the humid coastal belt. 3/-.
Downing's.—Medium, long, black, irregular bearer, strong grower.
Gorgeous.—Extra large, jet black, superior quality, good bearer.
Hicks.—Large, glossy black, sub-acid flavor, the best for the coastal belt, often bears two crops a year, the earliest, and very prolific in districts where frosts are light.
Ironclad.—Large, black, strong grower, prolific.
Lick's American.—Large, black, vigorous.
Monarch.—Medium, white fruit, not fruited here yet.
New American.—Large, black, good bearer, vigorous.
Noir de Spain.—Large, black, good bearer, strong grower.
Prolific.—Small, black, prolific bearer, strong grower.
Stark.—Medium, black, prolific, vigorous.
Stubbs.—Large, black, over inch long, good quality, prolific, mid-season, promising.
Townsend.—Medium, fair quality, extra early, vigorous and prolific bearer.
Travis.—Medium, blackish, fair quality.

QUINCES

Worked on Quince Stocks; commence bearing 2nd-4th year after planting.

1/9 each, 18/- per dozen, where not otherwise priced.

Very hardy; thrive best in low moist soil and situations, but will do almost anywhere; useful for culinary, preserving and drying purposes.

- Bourgeaut.**—Large, golden yellow, good quality, good bearer, late.
Champion.—Large, pear-shaped, yellow, fine flavor, prolific, late.
Fuller.—Medium, yellow, prolific, fine flavor, very early.
Giant of Lescovaz.—Large, yellow, flesh white, prolific, mid-season.
Master's.—Medium, yellow, good quality, bears well, the earliest.
Missouri.—Very large, yellow, mild flavor, bears well, scalds at times, early.
Pineapple.—Large, yellow, smooth, tender flesh, heavy bearer, mid-season.
Portugal.—Large, deep yellow, heavy bearer, one of the best, splits easily in rain, late.
Rea's.—Large, roundish, yellow, fine quality, mid-season.
Smyrna.—Large, yellow, tender, prolific, mid-season.
Van Dieman.—Medium, yellow, smooth, fine flavor, mid-season.

OLIVES

Commence bearing 5th-7th year after planting.

In pots. 2/6 each, 27/- per dozen, where not otherwise priced.

Thrive best in poorish soils and temperate climates, although fairly hardy; chiefly used for oil, pickling and canning. Make fine breakwinds and tall hedges in suitable climates. For further guidance in Olive culture, see Bulletin 82, issued by the Department of Agriculture.

Bouquettier.—Medium, good bearer, valuable for oil.
Black Italian.—Large, fine flavor, good for pickling.
Correggolia.—Medium, good bearer, good for oil-making.
Hardy's Mammoth.—Very large, good flavor, good for oil or canning.
Large Fruited.—Large size, good flavor, good for canning.
Lucca.—Medium, heavy bearer, high oil percentage.

Nevadillo Blanco.—Large, good flavor, fair bearer, good for canning and pickling.
Picholine.—Medium, oblong, prolific bearer, good for oil.
Pigale.—Medium, fine flavor, good bearer, good for oil.
Salome.—Medium, fine flavor, good bearer, good for oil or pickling.
Verdale.—Medium, good for oil, good bearer.

NUTS.

Under this heading we have grouped various kinds of nut-bearing trees suitable for different climates. Most nut trees thrive best in deep, rich, free, cool, well-drained soils, and we would specially emphasise the need for regular and copious waterings during the two seasons immediately after planting as nut trees seem to be easily injured by dryness when not thoroughly established, and the watering enables them to get their roots deep down in the soil. A profitable crop if grown on suitable soils and climates, for at present the markets are under-supplied with local nuts.

ALMONDS

Worked on Seedling Peach Stock; commence bearing 3rd-4th year after planting.
 1/9 Each, 18/- per Dozen, where not otherwise priced.

Nut bearing tree, good for breakwinds where conditions are suitable, bear best in dry atmosphere, grow and flower well in humid coastal districts, but fruit does not set.

Burbank's.—Medium size, good bearer, late bloomer. Flowers Aug. 27th.

Early Jordan.—Large, paper shell, early flowerer, upright grower.

Eureka.—Similar in size and flavor to the Jordan, paper shell, heavy cropper.

Golden State.—Large, soft shell, smooth kernel, regular bearer. Flowers Aug. 26.

Harriott's.—Large, soft shell, sweet kernel, regular bearer.

Hatche's.—Large, paper shell, very thin, good bearer, promising here. Flowers Aug. 10.

I.X.L.—Large, paper shell, heavy bearer, good grower. Flowers Aug. 20.

Lewelling.—Medium size, soft shell, best cropper in coastal belt. Flowers Aug. 18.

Nonpareil.—Medium size, thin shell, prolific, weeping growth.

Paper Shell.—Large, paper shell, good bearer. Flowers Aug. 12.

CHESTNUTS

Commence bearing 3rd to 8th year after planting.

2/3 each, 24/- dozen, where not otherwise priced.

These nut-bearing trees are most suitable for cold climates, although the Japanese kinds do well on the coastal belt. Nuts of these are usually roasted before eating.

Japanese Tamba.—Large, bears early, makes a fine tree.

Korean.—Medium, shell breaks easily, good grower.

Spanish (Castanea vesca).—The well known Sweet Chestnut, a fine shade tree, attains a great age and enormous size, starts bearing about the sixth season of planting.

FILBERTS

Commence bearing 3rd-5th year after planting.

2/- each, 21/- dozen, where not otherwise priced.

A small nut-bearing tree, only suitable for cold, moist climates with a good even summer rainfall to develop and mature the nuts. These grow well in warmer climates but rarely produce any nuts. We recommend the planting of these as mixed as possible as inter-pollination is an important factor if payable crops are to be secured. Owing to small stock available, selection of varieties must be left to us.

MACADAMIAS.

Come into bearing 5th-7th year after planting.

2/- each, 21/- dozen, where not otherwise priced.

An evergreen native nut tree, growing about 20 to 30 ft. high, bearing good crops of round, extremely hard-shelled nuts of first-class flavor, which are usually sold in the shops as Queensland Scrub or Popple nuts. When transplanting these, always shade plants thoroughly from sun until they begin to grow, or they will wither, and often gradually die.

Macadamia Integrifolia.—Has a dark glossy green smooth leaf, few serrations, very prolific, and often bears nuts more or less all the year round, very rich quality, shells medium tough. 3/-.

Macadamia Ternifolia (Greer's Thin Shell).—This has a thinner shell than others, and is a good bearer, round nut, seedlings only. 3/6.

Greer's (Medium Shell).—Large nut, round shape, good cropper, fine quality. 3/-.

Greer's (Oval Thin Shell).—Fair cropper, but not so good quality as others. 2/6.

Waldron (Thin Shell).—Large nut, good quality, fine bearer, stock limited. 4/-.

Macadamia (Seedlings).—From selected nuts. 2/- each.

PECANS

An extremely fast-growing deciduous nut tree, closely allied to the walnut, equal in flavor, etc., but by some considered superior, and which is suitable for both warm and cold climates.

Come into bearing 5-12 years after planting.

2/- each, 21/- dozen Seedlings, where not otherwise priced.

Frostscher.—Large nut, good grower and bearer, thin shell, grafted. 10/- each.

Pecan.—Seedlings from selected nuts, begin bearing at 8 to 12 years.

Success.—Large, thin shelled nuts, good bearer, fair grower, grafted. 10/- each.

PISTACHE

A nut-bearing tree suitable for the dry inland climates, producing a medium sized nut, having a delicate flavor; chiefly used for flavoring confectionery. So far only an ornamental variety is available.

Comes into bearing 4th-6th year after planting.

Price 2/6 each, 27/- dozen, where not otherwise priced.

P. Chinensis.—A beautiful autumn foliage, rivalling the Japanese Maple, and being suitable for warm climates. We

would recommend planting in place of the Maple.

WALNUT

A fairly quick-growing tree, suitable for cool, moist climates, having a fairly even summer rainfall, and under which conditions usually bears good crops of nuts, but, if planted where too dry, nuts often fall off before being developed properly. Kinds suitable for warm climates are at present unavailable owing to the difficulty of propagating them.

Come into bearing 5th-8th year after planting.

2/3 each, 24/- dozen, where not otherwise priced.

Californian Black (*Juglans Californica*).—Large, hard-shelled, good grower.

English (*Juglans Regia*).—Large, common, well known.

Japanese (*Juglans Cordiformis*).—Large, hard shell, early fruiting, good bearer.

Japanese (*Juglans Sieboldi*).—Large, hard-shelled, good flavor, heavy bearer.

BANANAS.

Commence bearing 18 to 24 months after planting.

1/9 Each, 18/- per Dozen, where not otherwise priced.

Sub-tropical. Thrive best in warm climates free from frost, on deep, rich, free, well-drained soils, but will do in many sheltered positions where frosts are only light, or protection given when necessary. When frosts are too severe the

fruit ripens woody and inferior. Once a sucker has borne it should be cut down, as it will not bear again. Plant 10ft. apart in rows, and rows 10 to 12 feet apart.

- | | |
|--|---|
| <p>Cavendish.—Large, yellow, tender to frost, good bearer, dwarf grower.</p> <p>Gros Michel.—Medium, yellow, good flavor, tender to frost, tall grower.</p> <p>Plantain.—Large, yellow, cooking, stands cold fairly well.</p> | <p>Rajah.—Large, green, good flavor, resists cold fairly well.</p> <p>Sugar.—Small, yellow, sweet, stands cold well, fair bearer.</p> |
|--|---|

FEIJOAS

Commence bearing 2nd-3rd year after planting.
Grafted Trees. 5/- each, where not otherwise priced.

An evergreen, growing about 12ft. to 15ft. high, of fine ornamental appearance, and, being extremely hardy, can be grown almost anywhere in N.S. Wales. Fruit ripens in April and May, and resemble guavas in shape, and usually fall on the ground, and should then be stored until ripe. The flesh is a clear color, with minute seeds, having a delicate flavor all its own, giving out a strong aroma when ripe. Good as a table fruit or for jellies, jam, etc. Planting two varieties for pollination purposes is recommended. Grafted plants will not be ready before June.

- | | |
|---|---|
| <p>Choiceana.—Fruit oblong, about 3in. long, 2½in. thick, rich flavor, good bearer, skin greenish.</p> <p>Coolidgeii.—Not so large as Choiceana, but same shape, skin smooth and greenish, flavor good, excellent bearer. Reported in U.S.A. as being self-fertile, and does not require pollination.</p> | <p>Superba.—Large, oval, or apple-shaped, rich flavor, greenish skin, fair bearer.</p> <p>Seedlings.—Suitable for ornamental plantings or hedges, often bear crops of good fruit, but there is no certainty as to size or quality. 2/6.</p> |
|---|---|

GUAVAS

Commence bearing 3rd-4th year after planting.

In Pots. Price, 1/9 each, 18/- per dozen, where not otherwise priced.

Finely flavored fruits, either for dessert or preserving, thriving best in deep, free soils, where light frosts only prevail, excepting the Purple, which is very hardy. Plant 10 to 15 feet apart. Require little or no pruning beyond shaping and thinning of branches.

- | | |
|--|---|
| <p>Purple (Cherry or Strawberry).—Medium, purplish red, bears two or more crops a year, makes a superfine jelly, evergreen, ornamental shrub, will grow almost anywhere, and is very hardy.</p> <p>Yellow.—Large, yellow, pink flesh, aromatic</p> | <p>flavor, good dessert, good bearer, very profitable in suitable localities, deciduous in frosty districts.</p> <p>Parker's.—Large, creamy yellow, creamy white flesh, flavor not equal to yellow, fair bearer, semi-deciduous.</p> |
|--|---|

JUJUBES

Commence bearing 1st-3rd year after planting.

Price 5/- each, where not otherwise priced.

Chinese Jujubes (botanically *ziziphus jujuba*), the fruits of which are called Tsao by the Chinese, and often called red dates by Europeans resident there, owing to the similarity in appearance and texture to the ordinary dried date. A very hardy deciduous tree, thriving best in warm, dry climates, and withstands temperatures below zero, and also does well on alkaline soils. Heavy bearers of fruits, usually ripe in March, about 1½ to 2 inches in length, having a smooth brittle skin of rich dark brown color. The flesh is sweet, crisp and rather dry when fresh, and will probably be more relished when cooked in a sugary syrup and allowed to dry. Grafted plants available, which will not be ready before June.

Lang.—Large, pear shaped, red color, mellow flavor, good bearer (20-30 to lb.). 7/6 each, stock limited.

Li.—Very large (16 to 20 to lb.), 2 inches diameter, stone small, good eating or for processing, late.

Mu Shing Hong.—Medium, oblong (30 to 35 to lb.), fair bearer, red brown color, keeps well.

Sui Men.—Medium (30-35 lb.), long fruit, good bearer.

Ta.—Large, roundish, dark brown red color, medium grower.

Ta Hong.—Medium, round, dark red brown color, good bearer.

Tang.—Medium, roundish, brown red color, fair bearer.

Ta Yuan.—Large, oblong fruit (20 to 30 to lb.), good bearer.

Seedlings.—Often bear crops of good fruit, but usually fruit is much smaller and inferior than the named varieties. 2/6 each.

PINEAPPLES.

Commence bearing 18 to 30 months after planting.

Rooted Suckers. 1/6 Each; 15/- Dozen, where not otherwise priced.

These are more hardy than is generally supposed, and worth trying in most places along the coastal belt, and in other sheltered positions, where the full force of winter frosts are not felt. Do not manure with superphosphate.

Cayenne (Smooth Leaf).—Large, deep yellow, spineless leaves, good quality, prolific bearer, one of the best.

Ripley Queen.—Large, golden yellow, good quality, heavy bearer, one of the commercial kinds.

POMEGRANATES.

Commence bearing 3rd-5th year after planting.

Price, 1/9 Each; 18/- per Dozen, where not otherwise priced.

Thrive best in good, free soils in temperate climates. Hardy, deciduous shrubby tree, with extra large handsome fruits. In many places the fruit is highly esteemed for its medicinal properties. Plant 10 to 15 feet apart, require moderate pruning to produce regular crops.

Common.—Large, bright crimson, rather astringent flavor, fair bearer.

Granada de Regises.—Large, crimson, good bearer, sweet flavor, good.

Krymisi Kabugh.—Large, deep crimson, good flavor and bearer.

Krylezy.—Large, bright crimson.

Papershell.—Large, bright crimson, sweet flavor, thin skin, good bearer.

Sweet Fruited.—Large, bright crimson, sweet, fair bearer.

Spanish Ruby.—Large, bright scarlet, thin skin, rather sweet, fair bearer, moderate grower.

Wonderful.—Large, brilliant crimson, pulp rich garnet, juicy, excellent flavor, good bearer.

Yeli-Slaski.—Large, brilliant crimson, good bearer.

PASSION VINES.

Commence bearing 9 to 24 months after planting.

Thrive best in free, loamy soils in localities fairly free from frost, and can be planted any time, except during the cold winter months. Very quick growing, bearing heavy crops of fruit from 9 months after planting, largely used as a filler crop in commercial orchards to give revenue before permanent trees come into bearing. Usually bearing two crops a year, the main usually ripening in February-March, but by pruning away the fruiting growth in November it is possible to force fruiting laterals for the winter crop, which is usually most profitable. Plant 10 to 12 feet apart, on trellises 10 feet apart. B. and B. and any quick acting manures are the best for this fruit. In colder climates they live longer, and are slower to begin bearing. Better known as granadilla in U.S.A. and South Africa.

Banana (Tacsonia Mollissima).—About 4 inches long, yellow, very meaty, not as good flavor as Purple; better suited for salads than as fresh fruit; very suitable for covering unsightly places, as it is both ornamental and long-lived. In pots, 1/6 each; 16/- per doz.

Purple (Passiflora Edulis).—Large, purple, good for salads and eating fresh, the best commercial kind. In pots, 9d ea., 7/6 doz.; open ground, 1/3 a doz., 7/6 per 100, 60/- per 1000.

Perfecta.—Extra large fruit, sweet. In pots, 1/- each, 10/- a dozen.

RHUBARBS.

Price 6d. Each; 5/- per Dozen.

Will do almost anywhere, but likes plenty of water and liberal manuring, preferably cow or animal droppings. Plant 3 feet apart in rows, with rows 3 to 4 feet apart.

Common.—Large stalks, reddish crimson, hardy and prolific. | **Topp's Winter.**—Medium stalks, fine quality, winter grower.

GRAPE VINES.

Commence bearing 1st-2nd year after planting.

Cuttings Own Rooted. Price, 9d. Each; 8/- Dozen.

Before planting, all vines should have the roots cut back to 3-6 inches from cutting, and all broken and bruised roots removed. The top of the vine should be pruned back to the strongest case, and it left so that it has 2 or 3 good strong buds.

European vines to stake should be planted 6 to 8 feet each way, depending on richness of soil; but for trellis and American sorts plant 10 to 12 feet between the plants and about 8 feet between the rows. Prune back to 2 or 3 eyes each year.

Under the latest regulations issued by the Department of Agriculture, grape vines grown in, or received into, the Counties of Cumberland and Camden are prohibited from being sent outside that area, so we can only supply customers within these areas. The following kinds only are available:—

For effective manuring try a mixture of 2cwt. bonedust, 2cwt. superphosphate, 1cwt. sulphate of potash to an acre, or 2cwt. of blood manure to the acre.

Bell's (American).—Large berries, blackish purple, medium bunches, extra vigorous grower.

Black Hambro.—Large berries and bunch, black, good bearer, the best for coastal districts.

Isabella Impr. (American).—Berries large, black, medium bunches, foxy flavor, very vigorous grower.

Muscat Hambro (Snow's).—Berries and bunches large, black, fine flavor, good bearer, the best Muscat for coast.

Muscat Alexandria.—Berries large, amber color, fine flavor, subject to black spot on coast, good bearer.

White Sherry.—Bunches and berries large, pale amber green, prolific, the best white for coastal belts.

BLACKBERRIES

Commence bearing 2-3 years after planting.

Price 1/- each, 10/- dozen, where not otherwise priced.

Strong growing and vigorous, so that in many cases they have overgrown everything else. Fruits ripening in summer and early autumn.

Lawton.—Large berry, deep black, prolific bearer, vigorous, also other kinds available.

Himalayan.—Large black berry, ripens in late autumn, very vigorous canes, but does not sucker like the other kinds. 2/- each.

DEWBERRIES.

Come into bearing 2nd-3rd year after planting.

In pots. Price: 1/- each, 11/- dozen.

Similar to Blackberries in every way, except that they are not so strong growing and vigorous, and the fruits ripen in the spring.

Lucretia.—Ripens Sept.-Oct., black berry, medium size, good bearer. | **Red Lucretia.**—Similar to above, only has a reddish berry.

CURRANTS.

Commence bearing 1st-3rd year after planting.

Price, 9d. Each; 8/- Dozen.

Only crop well where there is a cold winter and moist climate. Plant 6 feet apart in rows 8 to 10 feet apart, and cut back each year.

Can supply varieties in Black, Red, or White.

GOOSEBERRIES.

Commence bearing 2nd-3rd year after planting.

Price, 9d. Each; 8/- Dozen.

Good crops only where there is a cold winter and moist climate. Plant 6 to 8 feet apart in rows 8 to 10 feet apart, and if extra large fruit is required cut hard back each winter.

Can supply varieties in Red, White, Yellow, and Green.

LOGANBERRIES.

Commence bearing 1st-2nd year after planting.

Price, 1/- Each; 11/- per Dozen.

The most suitable of the berries for our climate, fruiting in early Summer; fast growing, thrive best where soil is rich, and moisture abundant, but, with reasonable attention, will thrive almost anywhere. Being a raspberry Hybrid, the most appropriate treatment seems to be to train young runners every year, and to cut away old growth that has finished fruiting. Plant 6 to 10 feet apart.

Black Fruited—Large, long, black, black-berry flavor, prolific, thorny, vigorous. **Red Fruited**—Large, long, crimson, raspberry flavor, prolific, spiney growth.

RASPBERRIES.

Commence bearing 1st-2nd year after planting.

Price, 6d. Each; 5/- Dozen.

Require a moist location and cold climate to do real well. Plant 2 to 4 feet apart, in rows 5 to 6 feet apart, and cut canes out when they have finished fruiting.

Can supply varieties in Red and Yellow.

EVERGREEN RASPBERRIES.

Come into bearing 2nd-3rd year after planting.

Price 1/6 each, 15/- dozen, where not otherwise priced.

Pinks—Large, crimson berries, ripens September; not much flavor, fair bearer. **Rubus Ellipticus**—Golden yellow, very sweet, raspberry flavor, ripening Sept. to Nov., prolific bearer.

STRAWBERRIES.

Commence bearing 5th-9th month after planting.

Prices, 1/- a Dozen; 6/- per 100, where not otherwise priced.

The most suitable soil is a deep, rich, free loam, or even stiff soil deeply dug and heavily manured, which should be mulched and well watered to give a continuation of crops. From those planted in March and April a crop can be secured the following Spring. Plant in rows 2 to 4 feet apart, and 12 inches apart in the rows, cutting off all runners, as they appear, at least twice a year.

Creswell's—Large, red, fine flavor, hardy, prolific, best coastal variety. **Rhodes Special**—Large, long berry, red, good bearer, rather soft, good for home use.

Illawarra—Very large, red, good bearer, strong grower.

MISCELLANEOUS FRUITS.

Asparagus (Conovers)—1/6 per doz., 10/- per 100.

Avocado Mexican (Persea Americana)—Extra large, salad fruits, sub-tropical, seedlings only in containers. 5/-.

Brazilian Cherry (Eugenia Uniflora)—Small fruit, red. 2/6.

Casimaroa Edulis (White Sapote)—Large yellow, fine flavor. 2/6.

Cherimoya or Custard Apple (Annona Cherimolia)—Seedlings, 2/6. Choice raised. Grafted kinds available only in August. 7/6 ea. These should only be pruned in September.

Chinese Raisin (Hovenia Dulcis)—Small, woody fruit, fine flavor. 2/-.

Davidsonia Pruriens (E. 15)—Large, plum-like purple fruits, flesh purple, sub-acid, few seeds. 2/6.

Eleagnus Longipes—Red berries, ripening in early summer. 2/-.

Juneberry (Amelanchier)—2/6 ea.

Mango (Mangifera Indica)—Large, greenish yellow fruits, seedlings from selected fruits. 2/6.

Rose Apple (Eugenia Jambosa)—Large fruit, yellow. 2/6.

Tree Tomato (Cephomandra Betacea)—Fruit about size of an egg, brownish, peculiar flavor. 2/-.

CITRUS FRUITS

STOCKS.—No defined hard and fast rules can be laid down about which is the best stock. Lemon Stock (Citronelle) is undoubtedly the best for stiff subsoils and poorish lands, and quickest returns. Orange (sweet) Stocks are deeper rooting, and for loamy subsoil, or where roots can go deep, may be successfully used. On this stock trees grow slower the first few years, but if soil suits them they mostly recover later on; resists saline in soil better than lemon.

Sour Orange or Seville is sometimes used for silt soils, and is generally accepted as resisting more water than Orange or Lemon, but owing to difficulty of growing saleable trees, they are rarely available.

Trifoliata is a deciduous Stock with a strong dwarfish tendency in most soils, yet seems to suit deep, free, light sandy soils sometimes flooded, and usually grows a finer skinned fruit than the other stocks, but appears to be only suited for the one class of soil.

Pomelaw is sometimes asked for, but as there seems to be no special advantage with this stock, and on some soils has a distinct dwarfing effect, it is rarely grown by nurserymen.

PLANTING.—Best time for autumn planting is February and March, and if weather is mild, early in April may do; but if weather is moist enough, the earlier planted the better the result, as cold weather is unsuitable, particularly in heavy soil or frosty places. August and September—or later, if moist enough—are best for spring planting. When planting Citrus trees always wash off any puddle that adheres to the roots so they can be clean and we prefer, in mild weather, to leave the trees unpruned; but if weather is dry, or high winds prevail, it is best to cut back, and in extreme dry wind cut all the leaves off, too, and cover the barrel loosely with grass, bagging or paper to protect it. By so doing you can often get good results under adverse conditions. Leaves falling off spontaneously after planting is mostly a good sign, but when leaves remain on and wilt they should be cut off. For October or later planting, we recommend cutting all leaves before planting. For further guidance in Citrus culture we recommend Bulletin 90 issued by the Department of Agriculture, Sydney.

FAILURES in Citrus planting are often due to loose planting, for when planted properly the leaves on the tree can be sharply pulled off without in any way loosening the tree, and if the butt of the tree is held, one finds that it is hard to move. If moved easily, then it is not planted firmly enough.

PRUNING.—Citrus trees in their early years require little or no pruning beyond occasionally shortening shoots of excessive growth that would if unchecked tend to make the tree lopsided. Some of the inner growth of excessively grown trees may be with advantage thinned out.

WATERING.—When necessary we would suggest 2 to 4 gallons per tree after the tree has been planted and the soil trodden down firmly, then when water has drained away, fill in the balance of the soil.

MANURES.—Any good farmyard manure is beneficial and re-soiling is also good, but as artificial manures have mostly to be relied upon, we would suggest that a mixture of 6wt. of ammonia, 3wt. of super for inland orchards and the addition of 1½wt. of sulphate of potash for use in the coastal areas, and to use 1lb. of this mixture for each year of the age of the tree.

THIN-SKINNED FRUIT.—We are often asked to supply only thin-skinned varieties, but this is entirely a matter of soil, climate, and manure, as the same kind of tree planted in different soils is likely to be very different in the skin, and on black soils and all stiff clay soil the skin is much thicker than that grown on a light sandy loam. Heavy application of nitrogenous manure also puts thick skin on oranges and lemons, but corrects itself as the nitrogen is being exhausted. Young, vigorous growing trees also have thicker skinned fruit than older trees.

SEEDLESS FRUITS are not likely to remain so if varieties containing many seeds are situated close together, for the wind and insects are likely to pollinate the seedless varieties.

NAVEL REMARKS.—A good deal of contention and correspondence constantly arise about navels. They are undoubtedly the king of oranges in quality, but the most fickle and unreliable croppers of all, and unless soils and atmospheric

conditions especially suit them, they seldom give satisfactory results after they are a few years old. Deep, rich, free soils only seem to be suitable for navel plantations. It is very rarely that they mature a good crop if grown on soils with stiff clay bottom, as the fruit is liable to drop any time when weather conditions are unfavorable. It would appear that the dry inland atmosphere is more suitable for navels than the more humid coast, as the fruit seems to set and hold better.

BLOOD ORANGE COLOR.—Fruit edible early in the season, but does not show red color in flesh until late in season. Require a hot climate for the color to be very pronounced.

SECOND CROPS sometimes occur in citrus fruits, but with late kinds we recommend that they be cut away as the second does not usually ripen at a profitable period and causes the usual crop to be light.

CINCTURING:—This practice is sometimes used to enable a tree to carry a larger crop, and usually the fruits are finer in skin and texture of flesh is better, but unless the tree is in a good, healthy, thrifty, vigorous condition, is not advisable, and the best time for cincturing is usually when the flowers are about 2-3rds dropped, much about the same period as when currants are cinctured.

BUD SELECTION:—Tree from buds taken from orchards selected and under observation by the N. S. Wales Bud Selection Committee will not be available this season, as the work has not been in progress long enough to cut buds, but in 1930 we hope to have trees of Valencia and Washington from such buds; but all trees of Washington, Valencia, Joppa, White Siletta, Groverly, Emperor, Early Imperial, Lisbon, Eureka and Marsh buds have been cut from good bearing orchards.

ORANGES.

Worked on Citronelle Lemon Stocks; commence bearing 2nd-4th year after planting.

Available on orange stocks Washington and Valencia

2/- Each; 21/- per Doz., where not otherwise priced.

- | | |
|--|--|
| <p>Byfield.—Large, round, yellow, juicy, good flavor, very little fibre, seedless, heavy bearer, best described as a seedless Parramatta.</p> <p>Best's Navel.—Large, yellow, quality fine, good bearer, hangs well, late.</p> <p>Dunning's Navel.—Large, yellow, good keeper, late, some reports shy bearer.</p> <p>Foster.—Large, bright yellow, roundish, sweet, heavy bearer, early.</p> <p>Golden Buckeye Navel.—Large, long, pale yellow, smooth thin skin, fine texture, dwarf, weeping growth, early.</p> <p>Golden Nugget Navel.—Large, pale yellow, smooth, thin skin, free from rag, seedless, weak grower, early.</p> <p>Groverley Navel.—Large, yellow, flattish, not quite seedless, crops well, mid-season. The best Navel for poor soils.</p> <p>Holdfast.—Large, yellow, rather thick-skinned, hangs well, late.</p> <p>Jaffa.—Medium, yellow, sweet, prolific, dwarf grower, early.</p> <p>Joppa.—Very large, yellow, prolific, strong grower, hangs well, mid-season.</p> <p>Late Valencia.—Large, yellow, skin smooth and thin, good cropper, hangs till others are gone, the best late.</p> <p>Lue Gim Gong.—Medium, yellow, thin skin, juicy, good flavor, hangs well, good bearer and grower, late.</p> | <p>Maltese Blood.—Medium, yellow, tinted red, blood-red flesh when ripe, dwarf grower, late.</p> <p>Mediterranean.—Medium, long, yellow, good flavor, heavy bearer, moderate grower. Should only be planted in deep, rich soil.</p> <p>Navelencia.—Large, yellow, skin smooth and fine, payable if marketed as soon as colored, no good where heavy frosts prevail, early.</p> <p>Patterson.—Large, yellow, sweet, juicy, prolific, strong grower, midseason.</p> <p>Parramatta.—Large, yellow, sweet and juicy, prolific, strong grower, mid-season, good on poor soils.</p> <p>Paper Rind St. Michael.—Medium, yellow, thin skin, good bearer, late.</p> <p>Ruby Blood.—Medium, reddish yellow, flesh red, growth moderate.</p> <p>Siletta (Old).—Medium, yellow, good quality, good cropper, hangs well, late.</p> <p>Thompson's Navel.—Large, yellow, fine shiny skin, similar to Navelencia, market early.</p> <p>Washington Navel.—Very large, yellow, superfine quality, on poor shallow soil a shy cropper; should only be planted on well-drained, deep, rich, preferably sandy loam or volcanic soil; early.</p> <p>White Siletta.—Large, pale yellow smooth skin, good cropper, early.</p> |
|--|--|

MANDARINS.

Worked on Citronelle Lemon Stocks; commence bearing 3rd-4th year after planting.
2/- Each; 21/- per Doz., where not otherwise priced.

Known as Tangerines in U.S.A. and South Africa. This class also includes those which are crosses between Mandarins and Oranges.

- Beauty of Glen Retreat.**—Large, deep yellow, thin-skinned, rather tart here, heavy cropper, mid-season.
- Burgess.**—Large, yellow, solid fruit, good bearer, mid-season.
- Early Imperial.**—Medium, yellow, sweet, thin skin, medium grower, requires deep, rich soil, early, ripens April.
- Ellendale Beauty.**—Very large, yellow, flattish, good quality, very smooth and showy, hangs well, late.
- Emperor.**—Very large, yellow, regular bearer, mid-season, the leading commercial variety of N.S. Wales.
- Excelsior.**—Very large, reddish yellow, fair quality, heavy bearer, mid-season.
- Fewtrell's.**—Large, yellow, sweet and prolific, early.
- Fagan's Beauty.**—Large, flattish, thin smooth skin, sub-acid flavor, some fruits show navel mark, good bearer hangs well, ripens late, very like Ellendale Beauty in every way.
- Jacob's.**—Large, reddish yellow, thin-skinned, juicy, somewhat tart here, heavy bearer, early.
- Kiang.**—Large, yellow, fair quality, prolific, very early.
- King.**—Very large, yellow, rough skin, quality fair, hangs well, requires good soil, late.
- Muscio.**—Yellow, flattish, very late, hangs well, only suited for deep, rich soils.
- Oonshii (Satsuma).**—Large, greenish yellow, fair quality, seedless, stands frost well, pendulous dwarf habit, early.
- Scarlet.**—Medium, reddish yellow, peculiar flavor, heavy bearer, early.
- Seedless Emperor.**—Identical with Emperor in quality, but more robust grower, and quite seedless. Fruits, so far, medium size only.
- Thorny.**—Medium, yellow, solid, flavor unsurpassed, good bearer, mid-season. Aged trees should be thinned and manured to get good sized fruit. Makes good tub specimens.

LEMONS.

Worked on Citronelle Lemon Stocks; commence bearing 2nd-4th year after planting.
2/- each; 21/- dozen, where not otherwise priced.

Picked when turning light in color, or big enough, and stored for some time they become more juicy and thin skinned than if left on tree to ripen. For full guidance in storing and curing, apply Department of Agriculture.

- Chatsworth.**—Raised in Adelaide, large, good bearer, very juicy.
- Common.**—Large, yellow, sweet, rough-skinned, hardy, early.
- Eureka (Sweet Rind).**—Large, yellow, good quality, thornless, early bearer, not as strong grower as Lisbon, but a better summer crop, prolific.
- Genoa.**—Very large, yellow, good bearer, thornless, too coarse here.
- Lisbon.**—Large, yellow, juicy, prolific, largely cultivated, tree thorny.
- Meyer.**—Large, fairly thin skin, flesh amber, abundant juice, early and prolific bearer, frost resistance ahead of usual kinds, acid content under the standard kinds, suited for districts where other kinds will fail, and should stand down to 12 degrees of frost without injury.
- Variegated.**—Medium, leaves and fruit variegated, fair cropper, ornamental.
- Villa Franca.**—Medium, yellow, thin-skinned, good quality, few thorns, not as vigorous as Lisbon, but profitable for its summer crop on deep, rich soil.

CITRONS.

Worked on Citronelle Lemon Stocks; commence bearing 3rd-4th year after planting.
Price, 2/- Each; 21/- per Dozen, where not otherwise priced.

Mainly used for making candy peel; also makes a marmalade of strong Citron flavor; can be used 3 parts Citron to 1 of Pomelow to make a fine marmalade.

- Bengal Citron.**—Extra large, round, pale yellow, for preserving and peel.
- Citron of Commerce.**—Large, yellow, lemon shape, used for candied peel.
- Giant.**—Extra large, yellow.

CUMQUATS.

Worked on Citronelle Lemon Stocks; commence bearing 2nd-3rd year after planting.
Price, 2/- Each; 21/- per Dozen, where not otherwise priced.

Can be eaten out of hand, skin and all, but mostly used for preserving and crystallising. A flavor peculiarly its own. Dwarfish growth. Very prolific bearers. Makes fine tub specimens for ornamental purposes.

Round.—Small, yellow, hardy, very pro- Long.—Small, yellow, good bearer, peculiar
liffe, peculiar flavor. liar flavor.

LIMES.

Worked on Citronelle Lemon Stocks; commence bearing 3rd-4th year after planting.

Price, 2/- Each; 21/- per Dozen, where not otherwise priced.

Generally grown in warm humid climates, where lemons are not successful, and generally used for the same purposes.

Persian (or Sweet).—Large, roundish, Tahitian.—Large, greenish yellow, juicy,
yellow, sickly sweet, prolific. nearly seedless, prolific. The best.

POMELOWS, GRAPE FRUIT, or SHADDOCKS.

Worked on Citronelle Lemon Stocks; commence bearing 3rd-4th year after planting.

Price, 2/- Each; 21/- per Dozen, where not otherwise priced.

The Pomelow, or as it is incorrectly called, the Grape Fruit, is very largely grown in America. The flavor is a peculiar bitter-sweet, and said to be one of the most beneficial of all fruit juices for improving the digestion. Makes an extra fine marmalade.

Blood.—Very large, roundish, yellow,
good bearer, red flesh in hot climates.

Common.—Very large, yellow, roundish,
sub-acid, very thick skin, prolific.

Java.—Large, yellow, pear-shaped, sub-

acid, good bearer, young growth, red-
dish.

Marsh.—Large, round, pale yellow, seed-
less, heavy cropper, good grower, best
of all, the commercial variety.

SEVILLES (or Bitter Oranges).

Worked on Citronelle Lemon Stocks; commence bearing 3rd-4th year after planting.

Price 2/- Each; 21/- per Dozen, where not otherwise priced.

Mainly used for marmalades of various kinds.

Poor Man's.—Very large, round, yellow,
very juicy, smooth skin. fair bearer,
good marmalade sort, not a true Sev-
ille in flavor, dwarf grower; also used
as a grape fruit.

Seville Common.—Large, yellow, very
prolific. The market variety.

Seville Flat.—Large, round, smooth, yel-
low, good bearer.

KNIVES

We have imported a number of the best selected Kunde makes, and can supply in numbers and sizes as listed below. Prices quoted cash with order only. Postage 3d. each extra.

3123C

BUDDING KNIVES

- 30A—10 cm, ebonite handle 4/6 ea.
- 30A—10 cm., ebonite handle, left hand 4/6 ea.
- 30A—9½ cm., ebonite handle 4/3 ea.
- 31A—10 cm., ebonite handle 4/6 ea.
- 32A—10 cm., ebonite handle 4/6 ea.

GRAFTING KNIVES

- 23A—10 cm., ebonite handle 5/- ea.
- 23A—10 cm., ebonite handle, left hand 5/- ea.
- 23A—10½ cm., ebonite handle ... 5/6 ea.
- 23A—10 cm., wooden handle 5/- ea.
- 22A—10 cm., ebonite handle 5/- ea.

- 22A—10 cm., wooden handle.... 5/- ea.
- 24C—10 cm., curved ebonite handle 5/- ea.
- 21A—10 cm., ebonite handle 5/- ea.

COMBINED BUDDING AND GRAFTING KNIVES

- 3123M—10½ cm., ebonite handles, 2 blades 7/- ea.
- 3123C—9½ cm., ebonite handles, 2 blades 6/6 ea.
- 3000—10½ cm., ebonite handles, 3 blades 7/6 ea.

WHETSTONES (Best Belgian Crumb)

- Postage, 6d each extra
- No. 2 Quality 3/3 ea.
- No. 3 Quality 4/- ea.

Seccateurs or Pruning Shears

We have imported a number of the best selected Kunde makes, and can supply in sizes and numbers as listed below. Prices quoted cash with order only. Postage 9d. each extra.

SECCATEURS OR PRUNING SHEARS—Other sizes available.

124.—23 cm., checkered handle, leather fastener	6/-
124.—20 cm., checkered handle, leather fastener	5/6
124A.—23 cm., checkered handle, steel fastener	6/6
124A.—20 cm., checkered handle, steel fastener	6/-
125.—23 cm., smooth handle, leather fastener	5/6
125.—20 cm., smooth handle, leather fastener	5/-
123.—18½ cm., for rose cutting, etc., and ladies' use	3/6

SPARE PARTS for above.

Springs, large	4d. each
Springs, small	3d. each
Bolt with Nut; 2 sizes	6d. each
Brass Locking Gadget with Screws	4d. each
Plate Washers	3d. each
Steel Closures for 124A size	4d. each
Spring for Steel Closures	2d. each

- - ROSES - -

A FEW HINTS ON PLANTING ROSES.

SOIL.—Almost any soil will grow roses, but a deep, rich, clayey loam is the best, and the deeper it is broken up the better, and if available incorporate any animal manure at the time of preparing soil, for if applied at planting time too near the roots, the chemical action of the manure may damage the roots.

Newly-broken soil is often acid, or sour; but some lime worked into the ground some weeks before planting corrects the acidity. Sandy soil requires heavy and regular manuring (preferably cow) for roses to thrive well, for the more sandy the soil the poorer the plants grow.

POSITION.—Roses can be successfully grown where the location is not too much overshadowed by large trees, or where not shaded by buildings or fences for much more than half a day. An open situation, but sheltered from strong winds is best. Too much enclosure tends to mildew, and weedy spindly growth. On stiff retentive soils drainage should be attended to.

UNPACKING.—Plants usually arrive in good order, unpack, dip the roots in water, and then cover with a wet sack until planted. If plants should arrive dry, soak the whole plant in tepid water for twenty minutes to half an hour (water should be so warm that you can hold your hand in it without feeling the heat much); and, if still withered, bury plant in soil, and keep the spot wet for two or three days; then take out and plant.

PLANTING DISTANCES.—The best effect in a rose bed is often lost by indiscriminately planting of the strongest growers mixed with weak ones. Small growers should be planted in front and the strongest growers in the middle or background. For dwarf roses, four feet apart is the minimum for strongest and 2 feet sufficient for small growers. Standards should be planted 6-8 inches deep, 3ft. 6in. to 6ft. apart according to purpose required for; the closer planting gives a mass effect, and wider planting allows for specimen sizes, and in windy positions tie firmly to a stake. Climbers on a trellis should be planted 8 to 12 feet, depending on whether covering quickly is wanted or not. Pergolas should be 6 to 8 feet high, the same width, and that distance from plant to plant.

PLANTING.—In loose or deeply broken up soil, plant dwarf budded roses so deep that bud, i.e., junction of stock and plant, is about one to two inches below the surface of soil. Depth of planting should be largely governed by the soil; on stiff, clay bottom plant more shallow than on sandy or loose bottom. Too shallow planting makes them liable to blow over in wet, windy weather. Too deep planting in badly drained heavy soils tends to make them water-logged in wet weather.

If in windy place, don't fail to protect plant from wind until well established. Make holes wide enough to spread out the roots naturally without bending them. Give the tips of roots a downward tendency. Cut back long, straggly roots and any that have been bruised in transit. If there is a long taproot, shorten this also.

Don't put fresh manure on the bare roots, but work it well into the soil about the tips of the roots or leaving manuring until plants have started to grow.

Cover roots with finest soil you have to hand, and, when covered, tread down firmly, add more soil, then tread again. Fill up with old soil and tread down once more firmer still. Do not plant if soil sticks to the spade; leave it longer until dry and friable.

WATERING.—If soil is dry when planting, pour a bucket of water (more or less, according to the state of soil) into each hole, as half a bucket under the plant is better than two on top. Let water soak away before planting.

Avoid watering little and often after planting. If weather continues so dry that watering is necessary, make a hole close to plant and give a good watering in the hole.

Standard Roses require much more watering than bush roses when newly planted or during dry seasons.

MULCHING.—When planting in dry, windy weather, mulch with leaves, grass, litter, etc.; or, failing that, hill up the soil half-way up the plant, to act as a mulch; but, if weather is wet, leave plant exposed from bud upwards, till weather changes. Be sure and keep the surface soil loose around the plants. After heavy rain or watering, the soil sets hard, and, if allowed to harden, may kill the plants.

MANURING.—When well established, roses can use large quantities of manure. Fowl, pig, sheep or horse manure is best for stiff soil; cow manure for light; but any manure is better than none. Bonedust is very good, too. Farmyard manure is best applied in winter, artificial manure in spring; but manuring can really be done any time to established plants. Owing to the increasing difficulty of securing animal manures, artificial manures are now constantly used and we recommend a mixture of about 3lb. of superphosphate, 2lb. nitrate of potash, and 1lb. of sulphate of ammonia. A good handful of this spread around the plants two or three times a year is sufficient. When liquid manures are to be applied, see that soil is moist. If dry, give it a good soaking with water first. A good liming, say every 3 to 5 years, is advantageous as it tends to liberate plant foods already in the soil, and wood ashes spread around tend to keep mildew in check.

SUCKERS sometimes shoot from the briar stock, and can usually be told by the different colored growth, always with green or greenish yellow leaves that are usually smaller, mostly seven to a stalk and never produces a flower on its tip, and, when seen, remove soil around stem and pull suckers away with a twist, then replace the soil.

Named kinds always show a red tinge in the young growths, leaves are seldom more than 5 to a stalk, and a good type dwarf rose shoot always ends with a flower or two.

PLANTING TIME.—Roses can be planted almost any time when weather is moist; but the best time is from March to August (inclusive). The sap begins to rise about the end of July in Cumberland, and if planted then or early in August, failures in transplanting are, with reasonable care, reduced to a minimum. Those planted in early autumn often start before the winter, but if not properly cared for may die back later.

ARRANGEMENT OF PLANTS.—The earlier method of planting beds and borders, of mixed varieties, as diverse in habit, etc., as possible, is giving place to planting groups of a few varieties only with harmonising colors, which gives a more effective appearance to the garden, and allows sufficient flowers of the one color to decorate a vase or room.

EVERBLOOMING.—The number of flowering periods can be increased by cutting the blooms with long stems, and when Spring flowering is over to get another flowering by judicious watering and liquid manuring. This can be repeated depending on the length of Summer and the severity of Autumn frosts in colder climates.

FAILURES are sometimes reported and may be due to too loose planting (most common cause), manuring at planting, roots drying out after unpacking, soil acidity, poor drainage, excessive animal manuring or heavy frosts. When the latter condition is evident, plants gradually die owing to the evaporation from the exposed shoots, which are losing moisture which is not being replaced by the roots, whose activity is suspended by the low temperature. A covering of leaves, straw or litter will often save the plant, mostly by protecting it from evaporation, which is usually heavy when the air is dry and, if windy, the evaporation is accentuated. Nurserymen are often blamed for these troubles, but it must be noted that after the season is over, the unsold stock is usually transplanted under most adverse conditions, and it is rarely that the losses are as high as those sometimes reported.

CUTTING BLOOMS.—This should be done early in the morning just as the buds are about to open. Cut with as long stems as possible, and also cut to a leaf pointing outwards from the centre of the plant.

PRUNING.—The object should be to select a few strong, well-ripened shoots (the number depending upon the size and age of the plant). These shoots should be short jointed, and strong, and the nearer to the ground for dwarfs the better. All the unripened wood and old weakly shoots should be cut clean away. The remainder should be cut back according to the strength of the shoots or variety; the stronger they are the longer they should be left, care being taken to cut to an eye looking outwards. A light pruning may be given after the spring blooming, but if flowers are cut with a long stalk this will not be necessary. Climbers should have all exhausted and feeble wood removed, and where too thick thinned out, and the long leaders shortened, and the laterals cut to 2 or 3 buds. Winter pruning should be done in Cumberland about middle to the end of July, and where Springs are later or earlier accordingly.

DISBUDDING.—For exhibiting roses it is generally necessary to disbud to increase the size of flowers, and this is done as soon as the lateral buds are big enough to remove without injuring the main centre bud.

DISEASES AND REMEDIES.—Keeping plants healthy and in good condition will help to check diseases becoming established, as coarse, rank and weakly growths are usually first to succumb. (See page No. 51.)

NEW ROSES, 1929

The following novelties offered are, we think, the pick of the leading European and American growers, and the descriptions are the raisers', very much condensed, for, at the time our Catalogue goes to print in early February, the new roses have not had a fair chance to flower, hence we are unable to make any personal comments. However, from early April on, we may be able to give some candid opinions if desired, but actually suitability to our conditions is really only apparent after 2 or 3 years' testing, for the highly colored descriptions are seldom borne out by experience, and on the average not more than 1 in 50 new varieties are in cultivation 5 years after, for, beyond keeping our stock up-to-date, most of the importations are generally disappointing.

Price: 4/- each, 45/- per dozen, where not otherwise priced.

- Adele Crofton (H.T.) (A. Dickson).**—Cadmium yellow, overlaid with scarlet-orange; the back of the petal is shaded vermilion red; the color tones as the flower develops to a rich apricot; fragrant bloom of medium size; disease resisting foliage; hardy; flowers freely; strong.
- Advocate (H.T.) (A. Dickson).**—Rich crimson red, shaded darker crimson, and having a brightened zone at the base of each petal; with age the color develops to a crimson carmine with the bright red base still pronounced; the bud is very long and pointed; full bloom spiral formation; very fragrant; thoroughly hard, vigorous and free.
- Aphrodite (H.T.) (Easlea).**—Large, semi-double, color reddish coral with gold base, very fragrant, disease-proof foliage, very free, vig.
- Cherry (H.T.) (McGredy).**—Color sunflower yellow on outside, inner bright rose, veined deeper rose as flower ages, becomes carmine pink, flushed yellow, retaining its color to the last; large, fine form, lasts well when cut, free, mildew resistant foliage, vig.
- Clb. Hadley (H.T.) (Teschendorff).**—A fine climbing sport of this well known rose.
- Clb. Souv. de Georges Pernet (Per.) (Weston Rose Co.).**—A strong climbing sport of this rose.
- Duchess of Atholl (H.T.) (Dobbie).**—Color vivid orange, shot with old rose, large, full, very free, mildew-proof foliage, sweetly scented, vig.
- Edith Nellie Perkins (H.T.) (A. Dickson).** The outside is orient red, shaded cerise, the inner face is salmon pink, merging into orange salmon, with golden orange base, moderately full, spiral formation, sweetly scented, very free, very vigorous.
- Edward Mignot (H.T.) (J. Sauvageot).**—Large, full and globular, color rose, shaded crimson, reverse of petals amaranth, carried on rigid peduncle, vig.
- Frank Leddy (Dwf. Poly.) (Cutbush).**—Bright carmine lake, growth and habit Orleans type, free, vig.
- Frank Reader (H.T.) (H. A. Verschuren).** Growth strong and disease resistant, buds long, good shape; flowers large, perfectly formed, with high pointed centre, very floriferous; color creamy yellow, centre golden apricot; rose apple scent. Award of Merit, R.H.S., and Certificate of Merit, N.R.S.
- Furstin Maria Hatzfoldt (H.T.) (Boden).** Mildew-proof foliage; flowers large, full and perfect form; color dark crimson red; fragrant; growth strong.
- Ivanhoe (H.T.) (Easlea).**—Brilliant scarlet, shading to rich crimson, very prolific, vig.
- James Gibson (H.T.) (McGredy).**—Glowing crimson scarlet, with velvety sheen, large, full, fine form, opening freely in all weathers, mildew resistant foliage, vig.
- Julien Potin (Per.) (Pernet-Ducher).**—The most brilliant yellow rose yet introduced, a rich golden yellow that grows more intense as the flowers mature; the buds are long and develop into large, full flowers of beautiful form; sweet scented; growth upright; very floriferous.
- Konigin Luise (H.T.) (Weigand).**—A F. K. Druschki x Sunburst, large, full and perfectly formed, possessing great lasting properties; color white; described as an improved "K. A. Victoria"; vig.

- Lady Forteviot** (Pern.) (B. R. Cant).—Brilliant orange on inner face, with bright canary yellow the back of petals, being paler; large, high-pointed centre, fairly full, mildew-proof foliage, free, vig. Gold Medal, N.R.S.
- Locarno** (Dwf. Poly.) (De Ryter).—Vermillion orange, flamed dark red, large truss, free, vig.
- Madame La General Ardouin** (H.T.) (Chambard).—Foliage disease resisting, splendid shaped bud on rigid peduncle, flower extra large of beautiful form, color dark carmine shaded dark yellow and chrome; delightful perfume; vig.
- Madame Gregoire Staechelin** (Clb. H.T.) (Simon Dot).—F. K. Druschki x Chat. de C. Vougeot; buds long; very large single flowers of a delicate rose color; highly perfumed, very vigorous, a profuse bloomer. Gold Medal. Bagatelle.
- Magnifique** (Dwf. Poly.) (Sliedrecht).—Color bright pink, beautifully fringed double blooms carried in bold trusses; habit erect and bushy.
- Mari Dot** (Per.) (Simon Dot).—Flowers large, full, egg-shaped, opening well in all weathers; delightful fragrance; color cadmium yellow suffused dark red, passing to rosy salmon yellow. Gold Medal, Saverne, 1925, and Gold Medal, Barcelona, 1927. Vig.
- May Weterm** (H.T.) (A. Dickson).—It has been compared to "Mad. Abel Chate-nay" (a variety which it completely supersedes), but is in fact of decidedly richer coloring; the inner face of the petal bright salmon pink in the bud to deep flesh pink, then to pure light pink in the aged bloom; fairly full, high pointed formation, very free, vigorous, fragrant.
- Mariposa** (Dwf. Poly.) (Allen).—This is recommended as an improved Orange King, the orange red shade is deeper and more lasting, opens freely, vig.
- Mrs. G. Paton** (H.T.) (McGredy).—Brilliant orange, shaded carmine, large, fairly full, fine form, petals thick texture, very free, mildew-proof, vig.
- Nuntius Pacelli** (H.T.) (Leenders).—Dark green foliage, immune from mildew, flower large, full and egg-shaped; color white, centre cream; delightfully fragrant; vig. Awarded Gold Medal, Saverne.
- Portadown** (H.T.) (McGredy).—Color deep rich crimson, large, full, beautiful form, very free, vig.
- Rose Berkley** (H.T.) (McGredy).—Color deep rosy salmon pink, suffused orange, large, full, fine shape with high-pointed centre, very free, mildew-proof foliage, vig.
- Sarah Wright** (H.T.) (H. Morse & Sons).—Ophelia x Emma Wright, with habit and freedom of Ophelia; a beautiful shade of pink self color; flowers good size and fine form; vig.
- Scott's Columbia**.—A sport of "Columbia," color pure rose pink of delightful brilliance. Undoubtedly much the best sport of "Columbia," possessing all its valuable qualities.
- Trilby** (H.T.) (Dobbie).—Color rich salmon, large, full, exquisite form, very free, vig.
- W. E. Nickerson** (H.T.) (Easlea).—Rich glowing orange cerise, in the way of Lady Tnchiquin, but better grower, large, fairly full, free, vig.

NEW ROSES, 1928

Price: 2/6 each, 27/- per dozen, where not otherwise priced.

- Abol** (H.T.).—Pure white bud, sometimes edged pale pink, large, fairly full, good form, sweetly scented, free, vig.
- Agnes Roggen** (H.T.).—Color carmine, inside of petals lilacy white, free and strong.
- Amami** (H.T.).—Soft peach pink, large, fairly full, very free, good form, vig.
- Clb. Radiance** (H.T.).—A strong climbing sport of this well known pink rose.
- Countess Stradbroke** (Clb. H.T.).—Large, full, good shape, fragrant, color dark velvety crimson, fine foliage, free, vig.
- Cuba**.—Flower orange scarlet or Lincoln red on the back of the petals, and the inside of the petal is a rich scarlet crimson with carmine; long buds, large, semi-double, free, strong.
- Dainty Bess** (H.T.).—Pale salmon pink, blooms in clusters, sweetly scented, single, free, vig.
- Dr. E. M. Mills** (Hyb. Hug).—Color primrose with pink suffusion, early flowering, shrubby growth, semi-double, very free, vig.
- Emily Dodd** (H.T.).—Creamy yellow, changing to milk white, large, full, and quite up to exhibition standard; free and vig.
- Ernestine Cosme** (Hyb. Wich.).—Fire red with white eye, very vigorous, large pyramidal clusters of 75 to 100 single flowers.
- Everest** (H.T.).—White shaded cream, extra large, perfect form, very vigorous.

- Fascination** (H.T.) (Chaplin).—Rosy cerise shaded yellow, large, full, very sweetly fragrant, foliage glossy green, free, vig.
- Florex** (H.T.).—Large flowers, long pointed buds, brilliant coral, deepening to carmine, free, vig.
- Fontanelle** (H.T.).—Large, yellow rose with immense petals, good form, lasts well, strong.
- Gaiety** (H.T.).—Large, good bud, semi-double, orange, shaded Indian red, free, vig.
- Golden Salmon** (Dwf. Poly.).—Intense fiery golden salmon, large trusses, free, vig., very promising.
- Julia Countess of Dartry** (H.T.).—Color Tyrian rose, large, full, good exhibition form, foliage mildew-proof, free, fragrant, vig.
- Kardinal Schultze** (H.T.).—Reddish crimson shading to scarlet, large, full, fine form, sweetly scented, vig.
- Lady Mary Elizabeth** (H.T.).—Brilliant carmine pink, large, fine form, fairly full, fragrant, vig.
- Lord Castlereagh** (H.T.).—Color rich deep crimson, very free, semi-double, foliage disease resisting, fragrant, strong.
- Madame L. Hot** (H.T.).—Color reddish salmon, flushed rosy salmon, large, globular flower, long pointed bud, vig.
- Mervouw G. A. Van Rossem** (H.T.).—Shaded dark orange and apricot on a golden yellow ground, the reverse of the petals dark bronze, large flowers, full, beautifully formed, sweetly perfumed, disease-proof foliage, strong.
- Mrs. Fred H. Howard** (H.T.).—Deep nankeen yellow, flowers abundantly, tea fragrance, foliage not liable to mildew, strong.
- Margaret McGredy** (H.T.).—Geranium lake to orange scarlet, which does not fade, very large, full, perfect form, free, mildew-proof foliage, strong.
- Marion Cran** (H.T.).—Buttercup yellow, flushed cerise and rosy scarlet, full, nice form, fair size, mildew-proof foliage, strong, free.
- Oliver Mee** (H.T.).—Deep salmon, changing to deep salmon pink, buds are long and pointed, opening to large, full, high centred flowers, vig.
- Patience** (H.T.).—Color scarlet carmine, flowers large, full and exhibition size, very free, strong, vig.
- Rapture** (H.T.).—Medium size, deeper pink than Mdm. Butterfly, fairly full, fine form, free, vig.
- Souvenir d'Alexandre Bernaix** (H.T.).—Rich crimson scarlet, shaded fire red, large and globular shaped form, vig.
- Villa Pia** (H.T.).—Dark velvety crimson, large and full, bud large, free, strong.

ROSES—General List

Our Roses are budded on American Noisette (*Rosa Odorata*) and *Rosa Multiflora* Stocks, as we have found these stocks give the most general satisfaction.

STOCKS.—Some confusion seems to exist in the correct name of *Rosa Odorata*, for as far as we can ascertain in Sydney it is known as American Noisette; in Melbourne, Monthly Blush; in Adelaide, Boursault; and in Brisbane, Manetti.

Price 1/6 each, 16/- dozen, 25 plants £1/11/-, 50 plants £3/-/-, packing included. Postage or freight extra.

These prices apply only when the full number is taken at one time, as 50 plants done up in one consignment are much less trouble than are the same number done up in several consignments. For those living near railway station, it is best to have them by train, as stronger plants can be sent and more weight allowed in packing. Plants available for coming season are well advanced, and promise to be good plants by selling time.

ORDERING.—Purchasers having limited knowledge of Roses are often disappointed through selecting varieties seen in show trays and dealer's windows, which are not always average blooms grown under ordinary conditions, as dry summers followed by good rains will produce abnormal flowers. Hence we recommend that prospective buyers either consult experienced gardening friends, or else leave the selection entirely to us, stating whether good all round garden roses are required or exhibition kinds. In either case we will select the best varieties. Owing to the similarity in many of the names, and in order to avoid mistakes, customers are requested to write the names of varieties wanted clearly. Also please state distinctly whether it is Standard, Bush or Climbing plants you require, for the word **Standard** is often wrongly used to denote Bush plants.

SUBSTITUTES.—It is advisable to give a few supplementary names, as substitutes, in case any of those ordered are sold out. Particularly towards the end of the season is that necessary. If you don't wish substitutes, please write "no substitute" on order sheet.

DESCRIPTIONS.—Not hot air shots aiming only at special sales, but by experience and observation we make every effort to properly describe all roses in catalogue, but owing to the vast difference in soil, weather, elevation, aspect, and climate we find it impossible to give a description that will suit all localities and climates. Particularly is this so in the case of varieties with intense color or varieties containing various shades of color. In early spring or on hot days, yellows will often come white and reds come pink. These varieties often appear to be untrue, but they should not be condemned at the one flowering, as in most cases the Autumn is the best time to judge of the correctness of the labelling. Semi-double roses often last well when cut. Vig., strong, mod., poor, at the end of each description refers to the growth of the plant.

PETALAGE varies considerably and may be increased by disbudding and extra good attention. Semi-double varieties usually have more petals in autumn and early winter than in spring and summer.

H.P.—HYBRID PERPETUAL.—Chiefly spring-blooming, and sometimes in the autumn, not ever-blooming, but give a great wealth of flowers when in bloom. They are more hardy and resist frost better than the Teas. Invaluable for spring shows.

H.T.—HYBRID TEA.—Originated in a class between H.P. and Tea, but the various classes have been so intercrossed that it is now difficult in many cases to classify correctly. Everblooming and hardy.

M.—MOSS ROSES.—Only thrive to perfection in cold climates, mainly Spring blooming, and their beauty is the mossing on the buds before flowers are opened.

PER.—PERNETIANA.—Colors very intense, free flowering, growth strong in dry inland and cold mountain climates, but in warm humid climates inclined to die back. Very subject to Black Spot.

T.—TEA-SCENTED.—Mostly evergreen, very free, but more tender to frost and are not as hardy as the H.P.

America (H.T.).—Rose pink, large, perfect form, fragrant, free, strong.

Alexander Hill Gray (T.).—Sulphur yellow, large, good form, high pointed centre, free, strong.

Betty (H.T.).—Satin rose, tinted yellow, large, not full, good show rose, vig.

Betty Uprichard (H.T.).—Salmon pink, reverse glowing carmine, medium, almost semi-double, free, vig.

Black Prince (H.P.).—Dark crimson, large, rather flat, fragrant, strong.

Blanche Moreau (M.).—Large white, mossed, vig.

Caroline Testout (H.T.).—Satin pink, very large and globular, free, vig.

Catherine Mermet (T.).—Flesh rose, medium, full, excellent form, free, mod.

Clarice Goodacre (H.T.).—Chrome on ivory white, large, good form, strong.

Columbia (H.T.).—Peach blow pink, medium large, fragrant, often mis-shapen, best in autumn, free, strong.

Comtesse du Cayla (T.).—Nasturtium red, tinted carmine and copper, medium, semi-double, free, strong.

Chas P. Kilham (H.T.).—Orange orient red, suffused glowing scarlet, large, fairly full, free, mod.

Comtesse La Barthe (T.).—Rosy flesh, large, globular, not full, very free, vig.

Countess of Gosford (H.T.).—Salmon pink, large, not full, fine buds, very free, mildews badly, vig.

Crested Moss (M.).—Pink, medium buds, heavily crested with moss, vig.

Dame Edith Helen (H.T.).—Glowing pink, very large and full, perfect form, old rose fragrance, mildew resistant, strong, promising.

Dean Hole (H.T.).—Silvery carmine, shaded salmon, large, high centre, good show, mildews badly, strong.

- Devoniensis** (T.).—Creamy white, blush centre, large, full and sweet, strong.
- Dr. Hogg** (H.P.).—Reddish violet, large, full, fragrant, vig.
- Duchess of Sutherland** (H.T.).—Rose pink, large, good form, full, vig.
- Duchess of Wellington** (H.T.).—Saffron yellow, large, fairly full, long buds, strong.
- Duchess of York** (H.T.).—Golden yellow, centre deepening to tangerine, large, free, semi-double, poor.
- Earl Beatty** (H.T.).—Deep crimson, large, sweetly scented, free, vig.
- Earl Haig** (H.T.).—Reddish crimson, large, globular form, full, strong.
- Edgar M. Burnett** (H.T.).—Flesh tinted rose, large, full, fine form, fragrant, strong, good show.
- E. J. Moller** (H.T.).—Dark crimson, medium, full, good form, free, strong.
- Elegante** (H.T.).—Sulphur yellow, large, fairly full, free, mildew-proof, vig.
- Ethel Somerset** (H.T.).—Coral pink, large, full, high pointed centre, free, vig.
- Etoile de Hollande** (H.T.).—Dark red, medium, semi-double, fair form, rich fragrance, free, seldom blues or burns, good, strong.
- Etoile de France** (H.T.).—Crimson, large, sweetly scented, free, strong.
- Farbonkbonigen** (H.T.).—Inside coral red, outside silvery fawn, large, fairly full, excellent shape, free, strong.
- Florence Pemberton** (H.T.).—Creamy white, shaded pink, very large, strong.
- Firedragon** (H.T.).—Fiery red, large, full, mildew-proof, vig.
- Frances Gaunt** (H.T.).—Deep apricot, large, fairly full, good form, strong.
- Francis Scott Key** (H.T.).—Cherry red, large, full, good form, free, strong.
- Frau Karl Druschki** (Snow Queen) (H.P.).—Pure snow white, large, well formed, free, can also be grown as a climber, a good white.
- Francie Simms** (H.T.).—Rose Neyron-red, crayoned carmine; free, large, full, vig.
- General Superior Jansen** (H.T.).—Bright red, large, good form, very free, burns at times, vig.
- General Macarthur** (H.T.).—Rich crimson, large, full, rather flat, shaded scarlet, sweetly perfumed, very free, vig.
- George Arends** (H.P.).—Delicate rose, large, full, good form, fragrant, vig.
- George Dickson** (H.T.).—Velvety crimson with scarlet reflexes, large and full, fragrant, mildews, very vig.
- George Schwartz** (T.).—Bright buttercup yellow, medium, not full, beautiful buds, free, mod.
- Gloire de Chedane Guinnoisseau** (H.P.).—Vermilion red, very large, full, perfect form, strong.
- Golden Emblem** (Per.).—Cadmium yellow, large, fairly full, free, poor.
- Golden Ophelia** (H.T.).—Golden yellow, medium, perfect form, free; one of the best garden yellows; vig.
- Goldmine** (H.T.).—Golden yellow, large, full, fine form, free, strong.
- Gruss au Teplitz** (H.T.).—Bright crimson, medium, cup-shaped, very showy, good garden rose, very free, vig.

Salmon Spray (Hybrid).—Salmon color, large, semi-double, large trusses, free, strong, very vig.

White Orleans.—Pure white, a sport of Orleans, otherwise identical, vig.

CLIMBERS.

1/6 Each; 16/- per Dozen; 25 Plants £1/11/-. Postage extra.

The true climber throws long shoots, but flowers chiefly on the laterals, which are side shoots from the leading shoots. The main flowering period of Climbers is in the spring, but sometimes they give a fair blooming in the autumn if the weather is favorable. Many of the strong-growing sort (not in the Climbing list) can also be trained as climbers, and some in the Climbing list can also be grown as Bush plants. Such sorts as Marie Van Houtte, Warrior, Red Letter Day, Sunny South, and other strong growers suit well to train on low fences, etc. It takes longer time to cover the space, but gives more continuous flowering and less trouble in keeping in order than actual Climbers; but they are unsuitable for covering large spaces. Climbers can also be grown in the border if grown on poles or tripods. Climbers seldom flower the first year after planting, but usually make long growths. The prefix Climbing is only used where there are dwarf roses of the same name; and many of these climbing sports are often irregular in their climbing habit, and until well established these clb. sports should not be shortened more than one-third, for, if pruned severely may revert to the dwarf habit of growth. Those marked Pillar are not as strong climbers as the others.

Australia Beauty (H.P.).—Deep crimson, blues badly, large, rather flat, fine foliage and perfume.

Blackboy (H.T.).—Blackish crimson, shading maroon, large, semi-double, sweetly scented, mildew-proof, good.

Clb. Caroline Testout (H.T.).—A vigorous climbing sport of this favorite.

Clb. Columbia (H.T.).—A climbing sport from the well-known dwarf, Pillar.

Clb. Comtesse La Barthe (T.).—A vigorous sport of the dwarf sort.

Clb. Dean Hole.—A very vig. clb. sport of the dwarf variety.

Clb. Devoniensis (T.).—A vigorous sport of the dwarf sort.

Clb. General MacArthur (H.T.).—A vigorous climber of the dwarf.

Clb. Geo. Schwartz (T.).—Very free, and flowers well in winter, pillar.

Clb. Golden Ophelia.—A climbing sport of "Golden Ophelia."

Clb. Hoosier Beauty.—A climbing sport of the dwarf, Pillar.

Clb. Irish Fireflame (T.).—A climbing sport of the dwarf of the same name.

Clb. Jonkheer J. L. Mock (H.T.).—A climbing sport from the dwarf.

Clb. K. A. Victoria (H.T.).—Free blooming, irregular climber, pillar.

Clb. Laurent Carle (H.T.).—A strong climbing sport of the dwarf.

Clb. Lady Hillingdon (T.).—Deep orange yellow, free and good, strong climber.

Clb. Los Angeles (Per.).—A strong climbing sport of the dwarf.

Clb. Lyon Rose (Per.).—A strong climbing sport from the dwarf. Pillar.

Clb. Mdm. A. Chatenay (H.T.).—A strong, vigorous climber of the dwarf.

Clb. Mdm. Butterfly (H.T.).—A vigorous climbing sport from the dwarf.

Clb. Mad. Edouard Herriott (Per.).—A climbing sport from this rose. Pillar.

Clb. Mdm. Second Weber (H.T.).—A strong climbing sport of the dwarf.

Clb. Mrs. G. Shawyer (H.T.).—A strong growing climber of the dwarf.

Clb. Mrs. H. Stevens (H.T.).—Very vigorous, sport from "Mrs. H. Stevens."

Clb. Mrs. W. J. Grant (Belle Siebrecht) (H.T.).—A climbing sport of Belle Siebrecht, pillar.

Clb. Ophelia (H.T.).—A strong climbing sport of the dwarf, pillar.

Clb. Papa Gontier (T.).—A climbing sport from the dwarf sort.

- Clb. Perle des Jardins** (T.).—A climbing form of this popular rose, pillar.
- Clb. Pink M. Cochet** (T.).—A strong climbing sport of the dwarf.
- Clb. Souv. de Therese Levet** (T.).—A climber from the dwarf of that name.
- Clb. Sunburst** (H.T.).—A strong climbing sport of the dwarf.
- Clb. Sunstar** (Per.).—A climbing sport of the dwarf, pillar.
- Clb. White Cochet** (T.).—A strong climbing sport of the dwarf, good.
- Clb. White L. Tarquin** (T.), *Glorie de Blanches*.—Large, pure white, free.
- Cloth of Gold** (N.).—Sulphur yellow, large, good form, centre deeper, mildews badly at times, vig.
- Flying Colors** (H.T.).—Deep cerise, extra large, single, early flowerer, vig.
- Fortune's Yellow** (N.).—Bronzy yellow, shaded rose, large, semi-double, pillar.
- J. B. Clark** (H.T.).—Scarlet crimson, large, good form, free.
- Madame Driout** (H.T.).—Rose, red stripes on inside of petals, large, full, good autumn flowerer.
- Madame Jules Gravereaux** (T.).—Rosy pink, tinted yellow, large, full, fine form, good show, pillar.
- Marechal Niel** (N.).—Golden yellow, large, full, excellent form, fragrant, free, weak stems.
- Mermaid** (H. Braet).—Sulphur yellow, large size, single, very free, foliage shining green, pillar.
- Miss Marion Manifold** (H.T.).—Velvety scarlet crimson, full, good form, perfumed, gets bare at base at times, good.
- Noella Nabonnand** (T.).—Deep crimson, extra large, semi-double, sweetly scented, showy.
- Reine Marie Henriette** (H.T.).—Rosy red, sometimes crimson, large, full, good form, splendid autumn flowerer.
- Sachsengruss** (H.P.).—Flesh, shaded rose, extra large, full, good form.
- Sinica Anemone (The Cherokee Rose)**.—Silvery pink, deepening to bright rose, large, single, pillar.
- Souvenir de Mdm. Leonie Viennot** (H.T.).—China rose, shaded yellow, large, semi-double, free, good foliage.
- Walter C. Clark** (H.T.).—Deep crimson maroon, large, fairly full, fine form, sweetly fragrant, rarely blues.
- William Allen Richardson** (N.).—Deep orange, small, full, good form, free, flowers in trusses, pillar.

CLIMBING, BANKSIA, MULTIFLORA, WICHURIANA ROSES and THEIR HYBRIDS.

1/6 Each; 16/- per Dozen; 25 Plants £1/11/-. Postage extra.

Mostly small flowers, flowering in large trusses or clusters, spring blooming only.

B., Banksia; M., Multiflora; W., Wichuriana; H., Hybrid.

- American Pillar** (W.).—Rich pink, white eye, large, single, large trusses, mildew-proof, showy.

George Schwartz	Los Angeles	Sensation
Golden Emblem	Lyon Rose	Shot Silk
Golden Ophelia	Mdm. A. Chatenay	Souv. of Stella Gray
Gruss au Teplitz	Mdm. Butterfly	Sunburst
Hadley	Mdm. E. Herriott	Sunny South
Hawlmarm Crimson	Mdm. Seg. Weber	Warrior
Hoosier Beauty	Mamon Cochet	White Cochet

Ornamental Trees and Shrubs

PLANTING.—All plants grown in pots should be planted about the same depth as soil in pot, or if dry an inch or two deeper, and it is always advisable to water directly on the ball of earth, for although the surrounding soil may be moist yet until the plant makes new roots it cannot draw any nourishment from the soil around it. Generally despatched in paper pots to save weight and packing, and only required to be knocked out of the pot at planting. Four inch pots usually weigh about 1-lb. each packed. If balled they can be planted as received, only cutting the ties on neck of ball, particularly if roots have come through ball. It is always advisable to give them a good soaking before planting. The numbers following give the average height in feet at full growth. Of course in rich soil some may grow more and in poor soil less. When planting next walls or fences, be careful to keep the plant far enough away to allow for its natural growth, and much better effect will be obtained in the future. The distance apart to plant depends largely on whether individual specimens are required or whether plants are wanted for mass effect, which means closer planting. The letter E means Evergreen; D, deciduous.

VARIEGATED PLANTS should be carefully watched as there is a tendency at times to revert to the green foliage, and, when occurring, the piece should be cut out at once.

TRAINING.—Some ornamental trees and shrubs are naturally inclined to grow straggly, but judicious pruning of the young growths will tend to overcome it and make nice compact specimens. Most shrubs are best pruned or shaped after the flowering has finished.

Abies.

Alba, E. 80, White Spruce	2/6
Excelsa, E. 90, Norway Spruce	2/6

All Abies prefer a cold climate.

Abutilon (Chinese Lantern).

Boule de Neige, E. 5, white	2/-
Cloth of Gold, E. 5, yellow	2/-
Emperor, E. 5, crimson	2/-
Rosæflorum, E. 5, rosy pink	2/-
Souvenir de Bonn, E. 10, foliage variegated, silvery white	2/-

Acacia (Wattle).

Baileyana, E. 20. The well known Cootamundra Silver. Yellow	1/6
Dealbata, E. 20 (the Tasmanian Sil- ver), lemon yellow	2/-
Decurrens, E. 20 (Black Wattle), golden yellow	2/-
Elata, E. 20; fine for street planting	2/-
Podalyriæfolia, E. 20 (the Queens- land Silver); the best; beautiful silvery foliage, yellow, fragrant ..	1/6

Acer (Maple).

Campestris, D. 30, English Maple ..	2/6

HEDGE PLANTS

- Bougainvillea Sanderiana.**—For warm climates; flowering over a long period. Plant 2ft. apart. 22/- doz.
- Bougainvillea Trailli.**—Similar to above, but darker and more profuse flowering. Plant 2ft. apart. 28/- dozen.
- Camphor Laurel.**—For tall hedges or breakwinds. For hedges, plant 4ft. apart; for breakwinds, 6ft. 18/- doz.
- Canna.**—For bedding and massing, 11/- per dozen. Plant 2 to 3 feet apart.
- Coprosma Lucida.**—Dark, glossy green foliage; hardy. Good for seaside. Plant 3ft. apart. 16/- doz.
- Crataegus Crenulata.**—An evergreen hedge, hardy, covered in autumn with berries; plant 2ft. apart. 18/- doz.
- Cupressus Torulosa.**—Used largely for breakwinds in cold climates. Plant 3ft. apart. Seedlings, 22/- doz.; cuttings, 39/- doz. Recommended in place of *Macrocarpa*, on account of the latter's tendency to die out in patches without any apparent cause.
- Duranta.**—A neat hedge; purplish blue; plant 2ft. apart. 16/- doz.
- Escallonia Macrantha.**—Dwarf hedge, suitable for hot or cold climate. Plant 3ft. apart. 18/- doz.
- Hibiscus (Single Scarlet).**—A showy hedge for warm climates. Plant 3ft. apart. 18/- doz.
- Lantana.**—For hedges; plant 2ft. apart. 16/- doz.
- Laurel (English).**—Good hedge for cold climates. Plant 3ft. apart. 16/- doz.
- Ligustrum Pubescens (Privet).**—Small leaves; good, hardy hedge. Plant 12 inches apart, 2/6 doz.; 15/- per 100.
- Ligustrum Lucidum (Privet).**—Large leaves; an excellent hardy hedge; disease and drought resistant. Plant 24in. apart. 2/6 doz.; 15/- per 100.
- Ligustrum Golden (Privet).**—A golden variegated foliage; plant 2ft. apart; hardy. 15/- doz.
- Olive (Common).**—A good, hardy hedge. Plant 2ft. apart. 16/- doz.
- Raphiolepis Indica (Indian Hawthorn).**—Dark green growth, white flowers, blue berries. Plant 2ft. apart. 18/- doz.
- Tecoma Capensis.**—Plant 2ft. apart, orange red. 16/- doz.

BREAKWINDS AND SHELTER TREES

We have grouped under this heading some of the more common ornamental and fruit trees suitable for and used for breakwinds, and also as shelter for animals. For breakwinds, plant 8 to 20 feet apart, depending on thickness of break required, for the closer planted they are the quicker and thicker the breakwind. For shelter, plant in groups of 3 to 20, so as to give good compact shade where required.

- Almonds.**—Deciduous, will give good payable crops in right climates. 18/- doz.
- Camphor Laurel.**—Evergreen, good for warm climates. 18/- doz.
- Cupressus Torulosa.**—Good in cold climates, evergreen, seedlings. 22/- doz.
- Eucalyptus (E. Botyroides), (E. Corynocalyx), (E. Globulus).**—Fast-growing evergreens; all are suitable. 16/- doz.
- Grevillea.**—For warm climates, but does not make a thick break. 18/- doz.
- Laurel (English).**—Good for cold climates; mostly used as a hedge. 16/- doz.
- Ligustrum Lucidum.**—A quick-growing break, evergreen. 2/- doz. 15/- 100.
- Loquats.**—Evergreen; for warm climates and usually very profitable, and makes a good break. 21/- doz.
- Macadamia.**—Evergreen; where suitable should make a good break, but somewhat slow-growing here. 21/- doz.
- Olives.**—Evergreen; makes a compact break; not fast growing. 16/- doz.
- Pears (China and Keiffer).**—Deciduous; sometimes used, and often profitable. 18/- doz.
- Peppers.**—Evergreen break for dry climates, not very thick. 21/- doz.
- Pecans.**—Deciduous, fast growing, should be a profitable break on good soils. 21/- doz.
- Pittosporum.**—Evergreen; but, as it is a host for Indian wax scale and borers, we cannot recommend.
- Pinus.**—One of the best for either cold or warm climates, fast growing, and does not unduly rob the soil. 16/- doz.
- Tristania (Lophostemon) or Brush Box.**—Evergreen, fairly fast growing and shallow rooting, one of the best for warm climates. 18/- doz.
- Syncarpia (Terpentine).**—Evergreen, medium growing. 21/- doz.
- Ulmus.**—Suitable for cold climates.
- Walnuts.**—Good where conditions are suitable. 24/- doz.

PLANTING HINTS.

In every human activity, opinions differ, so the following observations are meant for the beginners, who often ask for a few hints as to proceedings, for it is of utmost importance to give proper care and attention before and after planting.

UNPACKING.—On receipt of trees do not allow to lie at the station or wharf, maybe exposed to hot sun, wind, dry air, rain, or frost, but take delivery at the earliest opportunity, unpack, moisten the roots, and plant at once, if possible. If plants do not seem to be in good shape or unsatisfactory, notify us at once, as it is to our interest as well as yours to have your stock reach you in good condition. Avoid unnecessary exposure, for the natural place for the roots is in the ground. If trees are dry and withered on arrival, bury roots and tops in moist earth for several days. If unable to plant, heel the trees in.

HEELING IN, preferably in a loose, well-drained spot. Dig a trench or furrow about a foot wide and six to eight inches deep, and length according to number of trees. If you have a large number to heel in make the trench two or three feet wide. Stand the trees closely in trench, and shake loose soil well in amongst them, so as to cover the roots well; pack down firmly. Then fill in all the loose soil. Deciduous trees can be kept that way a long time without any detriment, but citrus or evergreens should not be heeled in longer than is absolutely necessary, and of these leaves should be cut off so as to relieve the strain on the trees.

PREPARING.—If the land you intend planting is new, or has been lying undisturbed for years, plough it fairly shallow the first time, preferably when it is dry, rather than too wet; leave it for as long a time as you can to sweeten, then harrow it down, and cross-plough it double depth, i.e., subsoil, or plough two furrows deep. The plough in the bottom furrow should have the mouldboard removed, so as to only loosen the soil, and not bring it to the top. The deeper it is stirred the better.

Land with loose or sandy subsoil will do without subsoiling (although we think it is profitable in all cases).

New land is mostly acid, or sour, and trees (particularly citrus) don't take to it until it is sweetened. Roughly breaking it up and planting **BEFORE IT IS READY** (so as not to lose a season) is mostly a good way of losing a season, particularly if weather sets in dry and windy.

CULTIVATION before and after planting is necessary as the soil is alive with bacteria or germs, and must be treated with the care, etc., that all living things demand, otherwise bacteria having a detrimental effect will predominate.

DRAINAGE.—It does not necessarily follow that elevated land is well drained, as drainage is through the subsoil, and the red and white clays, irrespective of elevation, are too retentive for best drainage, unless of a good gravelly formation.

ASPECT.—Any average soil will grow fruit trees, provided it is well worked, but in selecting a site for an orchard an easterly to north-easterly aspect is best. However, in small gardens, where these conditions are not always available, good treatment will give satisfactory results. The matter of shelter for orchards, if not naturally provided, should be of the first importance, as also natural drainage and convenience of position. Avoid low-lying land if possible if suitable land can be procured at higher levels. The higher land will be easily drained should it be necessary to do so. On low-lying lands the cold air settles and frosts are more frequent, severer, and later than higher up.

DISTANCE APART FOR TREES.—The usual distance is 20 feet, but in rich soils it may be necessary to space 22 to 24 feet, or even more, and in small gardens where water is always available, trees can be planted 12 to 16 feet apart, provided they are well treated and cared for.

STAKING AND HOLES.—Stake out well in advance, so that you can work the soil for about 3 feet distance around the stakes, and have it in good order at planting time, especially for evergreens. If you have many to plant, have the holes opened out before the trees arrive. Use a flat hoe or spade, and make holes 8 to 10 inches deep and about 2 feet in diameter. Holes should be as deep, or deeper, at sides than the centre. Be careful not to dig deep holes for trees where the subsoil is stiff and will not allow the water to soak down. It is best to work the whole land at an even depth, as potholes under the trees cause the soil in the immediate neighborhood to get sour; and only quinces, persimmons, and pears can grow in sour soil. Digging large holes in hard shallow ground and then planting in them will not give the best results unless the remaining land is cultivated quickly afterwards.

POSITIONS FOR FRUIT TREES.—If the orchard is on the average fairly well drained slope the highest parts should be allotted for Apricots, following on in succession in the order named down the slope, with Peaches and Nectarines, Plums, Apples, Pears, Quinces, Persimmons, and Nuts. Where the citrus family are intended to be planted, they also should have a high or well drained position. All Citrus and Stone fruits should never be planted where there is a possibility of stagnant water around the roots.

TIME TO PLANT.—Deciduous fruit trees, such as Peaches, Plums, Apples, etc., should be planted during May, June, July, and August; and, in dry districts, it is advantageous to plant as early in the Winter as possible, always provided the soil is reasonably moist; for, although trees are dormant, the roots remain active. Evergreen trees, such as Oranges, Lemons, etc., can be planted at almost any season of the year, but late February, March, and April are the best months for Autumn planting, and August, September, and October for Spring planting. Only plant in Winter months in localities fairly free from frost. It is better to plant for citrus, if land is ready, when weather is favorable, than to wait for any certain, set period.

ROOT PRUNING.—Tap roots are the long, coarse, downward-tending roots, generally without fibres or small side roots. In shallow soil, or where subsoil is stiff and retentive, cut back the tap-root, or bend to one side. In deep soil, or where the subsoil is porous, let it remain in its natural position. Some trees have hardly any taproots at all. Cut the jagged ends of all the larger and lengthy roots, and any that are bruised and damaged in transit, smooth and clean with a sharp knife so that when the tree is placed in position the roots will assume a natural position.

DEPTH OF PLANTING.—A safe rule is to plant about same depth as tree stood in the nursery; that can be seen by the lighter color of the bark where the soil covered it. Citrus and stone fruits are most liable to gum, and should not be planted deep. Walnuts, Persimmons and Pears should be planted two or three inches deeper than they stood in the nursery, and the tap-root of the three last named planted full depth straight down. If you have any difficulty in judging where the ground line is after hole is open, put a chalk mark on the stake near the ground before opening the hole.

PLANTING.—Don't take out too many trees at one time. Roll a wet bag around the roots. In windy or hot weather see that all roots are kept moist while you are operating; carry a kerosene tin or bucket of water with you, and dip the roots of each tree in the water just before you plant it. As the roots of each tree vary in depth you may in some holes have to fill in soil before putting in the tree, or it would be too deep; or you may have to scoop out a little soil for the deeper roots. Fill in some of the finest soil, and try to distribute the roots as evenly as their position will allow, and press the soil well in amongst the roots near the main stem, and put your fingers under the topmost roots and pull them up out of the soil, and outwards, so that only the lower roots are covered in the first lot of soil you put in. Then fill in more soil, and proceed in the same way until all the roots are covered and lay well embedded, and at different depths; all the while see that the soil is set firm around the main stem of the tree. Then with your foot press the soil down firmly. Unless the soil is very wet and heavy, you can hardly plant too firm (too loose planting has killed thousands of trees). Finally fill in the rest of the soil and leave surface loose. Tie the trees firmly to the stake, but cross each tie between the stake and the tree, or insert some grass or soft material to prevent the tree from chafing. At all times avoid planting when extremely wet or during high drying winds. In districts where frosts are severe enough to loosen the soil around newly planted trees, we would suggest treading the soil firmly down every time this occurs, otherwise the plant may die through being dried out by the loose soil.

EVERGREENS have more difficulty in establishing themselves, particularly if weather conditions are unfavorable, and those who find it difficult to secure good results we recommend to cut all leaves off either before or after planting and cover the barrel loosely with bagging, paper and grass for protection. In windy weather or late planting it is safer to do so, if leaves curl and remain withered, cut off at once, for if left on they will dry the vitality out of the tree; leaves falling off spontaneously is generally a good sign.

TREES TENDER TO FROST should be planted when weather is warm and moist, either in early Autumn or Spring and protected during the first three Winters.

Many kinds may be successfully grown in districts otherwise unsuitable, as mature trees will stand more frost than young ones.

PLANTING BALLED AND POTTED TREES.—Dig holes large and deep enough to admit the ball of earth. Soak the ball thoroughly before planting and then place in the hole about one or two inches below the general surface level. Then fill in with well pulverised soil around the ball, pack firmly, then water, and when soaked away, fill in balance of soil, disturbing the roots as little as possible. Watering often and right on the ball is essential until plant is established. If in paper pots merely lift out. In watering balled trees, it is very important to apply water thoroughly and for a long period, so that the moisture will penetrate through the ball of earth. Do not drag or jar balls more than necessary, as this is liable to loosen the earth, resulting in injury to the roots.

WATERING.—Deciduous trees, if planted in time, seldom need watering. should the spring be so dry that it is wanted, dig a narrow hole close to the tree, and pour the water in the hole, let it soak away, fill, and then mulch well, but do not press soil down which has been recently watered, as this tends to make the soil hard. Evergreen trees, in dry weather, need watering at planting. If the soil is very dry, put the water in either before you plant or just when the roots are covered and trodden firmly. If you have to water them later on, treat as described above for summer fruit. Nut trees seem to do better when regularly watered the first two years.

MULCHING is spreading either bush scrapings, leaves, stable manure, straw, grass, bark or sawdust around each tree for about three or four feet from the base of the tree, and from one to three inches deep. Close lying material, such as horse manure, requires less depth than loose lying stuff like straw or grass. Wet rank manure, or if of a closely matted texture, is not good as air is often excluded, and roots require air, and air of fair purity, and if used may damage root action by partial suffocation. It is particularly beneficial in dry windy weather, as it prevents the moisture in the covered ground from escaping so quickly and maintains a more equitable temperature about the roots. It is preferable that mulching takes place after the temperature of the soil has been raised and before hot dry weather sets in to be beneficial. Should not mulching material be available, the next best—if weather is unfavorable—is to hill up loose soil about each tree four to six inches deep and keep such hills well worked and loose. Wherever the surface soil is allowed to remain hard and crusty the moisture dries out very quickly. Citrus and other Evergreen trees seem to get away better with this extra attention.

MANURING.—On rich soils manuring at planting is not advisable, but on poorish soils a couple of handfuls of fertiliser is always beneficial, for it gives the tree a quick start. Spread it in the hole, and mix it in the soil before planting. On no account use manure in direct contact on the bare roots or too thickly near the barrel of the tree. Or you can leave the manuring until the tree has become established and started growing, when you can spread it around the surface of the ground and hoe it in. Bearing trees are best manured in late Winter or early Spring, and can either be manured by an application of about 3 to 5 lbs. of artificial manure per tree, or green manuring with cowpeas, etc., aided by a liberal manuring of superphosphate. For citrus it is often advisable to give a light manuring in early Autumn as well.

For older and bearing trees nothing is as good as top-dressing with new soil, as that builds up and improves the mechanical condition of the land.

CULTIVATION after planting is necessary to ensure successful results. Many failures are caused by planting in soil where it is too wet, or not stirring it up and airing it after a very heavy watering or rains. Do not neglect your trees by growing crops of cereals, grasses, vegetables, etc., right up to the young trees, for in dry weather such trees have absolutely no chance at all to do well, as the crop takes all the moisture. Newly planted trees should have a space of at least 4 feet all round quite free of other growth, and be cultivated 2 to 4 inches deep about three to five times the first Summer, by hoeing or shallow forking, but if properly mulched they will not require so much attention. Soil worked too wet packs together and excludes the air, and that destroys the bacteria life in it; consequently the plant does not thrive in it. Plants in such soil look quite well until the summer heat begins, when they generally turn yellow and gradually die. Stirring the soil often, and getting it into good condition around the roots, will often avert failure. White ants destroy more young trees than is generally suspected.

As the spring comes along, generally with drying winds, it is necessary to keep the soil loose and friable around each plant, and plants planted during wet

seasons or in heavy soil should be particularly attended to, as it is likely that such soil has got doughy or cakey and does not allow any air to circulate through it, and without a given quantity of air around the roots the bacteria life is inactive, and sickly or dead plants result.

SPRAYING.—It is not necessary to spray newly-planted deciduous trees, but it is an additional safeguard against infection. The best spray for this purpose would be Lime Sulphur or a coating of whitewash containing a little crude carbolic helps to prevent sunscald and attacks from borers. Very few plants exist that do not in some manner furnish food for something else, hence most trees, plants, etc., are subject to attacks from insects, scale, and fungi. For control and full guidance see Bulletin 72, issued by Department of Agriculture.

DEFOLIATION of trees sometimes occurs, and where not due to any disease or soil conditions it may be possible that, when the tree persistently remains partly defoliated, and leaves brownish and dead looking, that the atmospheric conditions are too dry, and evaporation through the foliage too rapid for such trees, which require a more humid atmosphere for complete success. Daily hosing of the foliage during hot, dry weather may help.

PROTECTING TREES.—If trees are planted where animals are likely to damage them or nearby roadways where they are likely to be damaged by vehicles, it is advisable to erect tree guards around them if the best results are to be expected, for damaged trees are often spoilt in shape, becoming hidebound and stunted, and often delayed in coming into bearing.

VARIETIES TO PLANT.—If, as a commercial investment, a large area is being planted, we cannot too strongly emphasise the necessity of confining the plantation to a few well-tested varieties that are known to do well in your locality, and have proved a profitable investment. Frequently we hear orchardists regretting the error they made when first planting, in having **TOO MANY VARIETIES**, and consequently they never have sufficient of any one sort to enable them to market in a satisfactory manner. Plant new and untried kinds for testing only, but in small gardens the aim should be to plant so as to have a continuous supply of fruit throughout the season.

RECORDING.—Remove all labels from trees, so that they may not cut the limbs. Use architect's cartridge paper or blue print for a permanent record or map of the names and varieties planted for future reference.

PRUNING FIRST YEAR.—To secure the best results, it is necessary to cut all deciduous trees hard back the same season as they are planted. If the tree is a single rod, cut it off about 15 to 18 inches above the ground (more height can be given if you wish, but low set trees are best). If tree has a head—as most of them have—remove all but three to five of the best situated branches, and cut the selected ones back to within 6 to 8 inches from where they join the stem. See that you cut them over an outward pointing bud; but if the limbs sit so that one side wants filling, see that the bud you cut over points in the direction of the gap you want filled. The best plan is to plant your tree unpruned, and leave the head on until the spring, just as the sap is rising. The roots seem to be more active if head is left till spring than if cut at planting time.

PRUNING is essential for good fruit, and to grow a tree that will carry good crops later, hard cutting is necessary in the early life of tree. When that objective has been obtained, then modify the hard cutting so that the energy of the tree makes fruiting growth instead, and when the tree has begun bearing only prune sufficiently to renew the fruiting growth as required by the tree. And it must be noted that apples, pears, cherries and apricots and English plums bear most fruits on the spur growth consequently slower in bearing than peach, nectarine and Japanese plum, which mainly bear on the last season's growth, so it is necessary to prune accordingly.

For irregular bearing trees we would suggest the long Leader system or some form of it to improve the bearing. For full guidance in pruning we recommend the booklet on Pruning by W. J. Allen, issued by the Department of Agriculture.

SUMMER TRAINING OR PRUNING.—The first summer the trees generally don't grow enough for summer pruning. But should the growth be sufficiently strong, then treat as described below. In the second and third years the growth is generally strong enough to benefit by summer pruning, hence as soon as the leading shoots have reached the point where you wish them to branch, usually about 12 to 20 inches long, depending on variety, pinch the soft tops off with your fingers, for this forces the growth to branch again without checking the flow of sap. Don't leave them grow long and wood hard before you touch them, as that often retards their growth, particularly if weather is dry. The aim of summer pruning is to make

strong limbs branch into good shape, so as not to sacrifice too much growth when winter pruning. Don't do any summer pruning so late that there is not good chances of good growth afterwards.

FROST PROTECTION.—The handiest protection is by placing boughs of trees, cane, or cornstalks, etc., firmly into the ground in a circle around the tree, or tall stakes placed in such positions that a covering of bagging or cloth can be thrown over on each occasion frost threatens. In very frosty localities it may be advisable to hill up the soil a few inches around the plant for, in the event of the top being frozen and killed, sufficient is left to enable the plant to re-establish itself.

POLLINATION.—Many varieties do not crop as well if planted in block by themselves as if other sorts, flowering at the same time (or slightly earlier) are planted amongst them. This is usually due to the pollen—or yellow dust in the flower—which will not readily fertilise its own flower. Many orchardists find it profitable to keep a few hives of bees in the orchard, as in flying from bloom to bloom some of the pollen is carried from flower to flower, thus pollinating them. To minimise non-cropping it is found advantageous to plant a bit intermixed. For instance, if planting, say, 100 Granny Smith apple and 50 Jonathan, instead of planting the 100 in a solid block and the 50 in another, it is better to plant two rows of Granny Smith and one row of Jonathan, two more of Granny Smith, and one of Jonathan right through. Some prefer to bud a branch of the pollinating variety on the windward side of the tree. For full information on this matter apply to the Department of Agriculture, Sydney.

TOP WORKING.—This is often done to save time and to change unsuitable kinds into more profitable trees. Some prefer to cut hard back and then graft the required variety on the top of the stumps; but we think surer and better results can be secured by cutting back to stumps in the winter or early spring, and then leaving 2 to 5 of the strongest shoots on each stump to be budded the following summer or autumn.

BREAKWINDS.—If your land has not a natural breakwind, it is a decided advantage to plant one on the side of the prevailing wind (this is generally west). The quickest growing and most effective is *Pinus Insignis*, which, although a shallow rooter, does not seem to affect the fruit trees. Other trees used for the same purpose as Loquats (for warm districts), Sugar Gums, Blue Gums, *Tristania*, *Cupressus Torulosa*, and Walnuts. See special list.

FILLERS are quick-bearing trees planted between others where pears, apples, walnuts, and other sorts that take a few years before bearing commercially paying crops, are planted. Many plant an extra tree in between each tree planted for permanent occupation, but such fillers should only be quick-growing and early-cropping kinds, such as Japanese plums, peaches and passion fruit. Rightly handled they will often pay the working expenses of the orchard until the permanent trees come to payable age, but the fillers should not be allowed to remain so long that they injure the permanent trees by encroaching on them. The reasoning is that the extra cost is only the purchasing price of the filler trees, as the cost of working is no more than if only permanent trees are planted. Where the land is worked by horse implements the fillers should be planted in rows with the permanent trees, so as to allow a clear land between the rows one way.

Of course where the intervening space is used for berry bushes or vegetables, fillers would not be advantageous. But hay, grain crops and pumpkins seem very destructive to young trees, except perhaps in very rich deep soil.

THINNING FRUIT.—To get the best color and size in fruit it is necessary to thin out the fruit on such heavy croppers as Trivett's apples, many of the Japanese plums and some peaches, as some years they set more fruit than they can bring to maturity in first-class fruit, and if allowed to carry more than is reasonable, the tree gets a set-back and takes one or two years to recover its normal strength to carry another good crop. Judicious thinning tends to more even annual crops, less labor in picking and grading, and prevents breakage of the limbs. A light dressing of quick-acting fertiliser, such as sulphate of ammonia, with a little muriate of potash, just after the fruit has set helps to bring a very heavy crop on, but it does not bring as good grade fruit as thinning, and if weather remains dry the fertilizer is more or less inactive.

STORING AND PICKING late Pears and Apples best if allowed to remain on as late as possible, as the fuller the maturity the better the keeping; observation will show that, when fruits part readily from the spurs, that they are ready to pick, and doubt can be determined by cutting a few fruits, and, if pips are brownish color, they are fit. Shrivelling sometimes occurs, and may be due to picking too soon, or storing in too dry an atmosphere. Where suitable sheds are unavail-

able, small quantities may be stored in boxes in such materials as dry, clean chaff, sand, bracken, and special wrapping paper. Early kinds are best used direct from the tree as their season is soon over. For full guidance, apply to Department of Agriculture, Sydney.

PULPING FRUIT.—See Bulletin by the Department of Agriculture.

PACKING FRUIT.—See Bulletin 130, by the Department of Agriculture.

PRESERVING FRUITS.—See Bulletin 88, by the Department of Agriculture.

DRYING FRUITS.—See Bulletin 52, by the Department of Agriculture.

GRAFTING WAX.—4lb. of resin, 2lb. of beeswax, 1lb. of mutton tallow, or linseed oil 1 pint; dissolve over a slow fire, and apply warm with a small brush. If necessary to apply this with the hands, it is best to keep them well greased, so as to prevent the wax sticking to them. For root grafting wax, 1lb. Beeswax, 2lb. resin; melt resin first, then add the beeswax; when these have melted and mixed, allow them to cool until beginning to thicken, then add denatured grain alcohol $\frac{1}{2}$ pint, and stir until wax becomes a glairy golden color. For open air grafting liquid wax: Resin 1lb., beeswax 1oz., turpentine 1 tablespoonful, alcohol 5oz.; resin should be melted, removed from the fire, tallow added and liquids stirred in gradually; this mixture remains fluid; then bottle and apply with brush.

PEST REMEDIES—FUNGOID, SCALE, INSECT

We are often asked to recommend controlling remedies for the various pests which affect the fruit tree, and as many of these applications reach us during our busy season, hence often we are not able to deal with them as fully as we would wish. We here-with give below a few approved remedies for control. Concentrated and prepared mixtures can be bought at most stores, which are most convenient and economical for those who only have a few trees to do. For full guidance, we recommend Bulletin 238. issued by the Department of Agriculture, Sydney.

Ammoniacal Copper Carbonate.—Copper carbonate 5oz., ammonia 3 qrts., 40 to 50 gallons of water. Make a paste of the copper carbonate and a little water, add the ammonia, which will dissolve the paste, and then dilute to 45 galls. of water. To be used when Bordeaux cannot be applied on account of staining the fruit; use a wooden bucket.

Aphelinus Mali, the woolly aphid parasite, eliminates spraying for this trouble. Apply to Department of Agriculture for colonies of this parasite.

Aphis.—Nicotine Sulph., Oil (1:40); Lime Sulphur (1:40), or Sunlight Wash.

Apple Blotch.—Bordeaux, 4, 6, 40.

Apple Leaf Jassid.—Spray Nicotine Sulphate (Blackleaf 40), 1 pint 100 gallons water, with hard soap added at the rate of 1lb. to 50 gallons of solution, or Lime Sulphur added 1-35 of the solution. The best time to spray is when the young Jassids are first noticed in early spring.

Arsenate of Lead.—For the first spraying use at the rate of 2lb. Arsenate of Lead (commercial form) to 50 gallons of water for Codlin Moth. This should be applied just as the petals have fallen and before the calyx has closed. Spray again in 21 days, then again in about six or nine weeks. Three applications will usually control the pest, but four applications may be necessary. Apply strong pressure for leaf-eating insects. Use a medium nozzle, neither too fine or too coarse.

Atomic Sulphur.—A prepared mixture of fine sulphur and adhesive matter.

Armillaria.—Open out soil around the base of the tree and swab with sulphate of iron or strong Bordeaux. If soil is opened up around and under the butt to let the sunlight in, it often helps. Where this trouble is prevalent, make a mound of soil and plant in that.

Bandage Traps.—Double a piece of hessian or bagging and tie loosely around the trunk of a tree, and examine for larvae every 7 to 10 days.

Beetles.—Paris Green or Arsenate of Lead.

Bicarbonate Soda.—1oz. Bicarb. Soda to 1 gallon of water for mildew on roses.

Black or Brown Scale.—Oil or Oil Soda.

Black Spot, Grapes.—Bordeaux 4, 4, 40. Spray till crop is cut.

Black Spot, Roses and Trees.—See Sulphur Arsenate or Bluestone Lime.

Bluestone Paste.—1½lbs. Copper Sulphate, 4lbs. unslaked lime. The lime should be slaked to a pasty condition in $\frac{1}{2}$ gallon of water, the bluestone dissolved in one gallon water, and then the two solutions mixed together, and stir well.

Bluestone Lime.—4oz. bluestone, 4oz. stone lime, 2½ gallons water.

Bluestone Soda.—6lbs. bluestone, 9lbs. washing soda, 50 gallons water.

Bordeaux.—Lime, 4lbs.; bluestone, 6lbs.; water, 40 gallons. Slake lime with a little water, then dissolve bluestone in a little hot water. Stir well. A coarse nozzle is required for this wash.

Bordeaux Paste.—1lb. bluestone, 2lbs. fresh lime, 1½ gallons water. Dissolve blue-

stone in 1 gallon water and slack lime in $\frac{1}{2}$ gallon water; pour together and stir well.

Borers in Fruit Trees of All Kinds.—Fill holes with methylated spirits. Penetrate holes with thin wire; destroy badly infected trees in which it breeds. Whitewash with a little crude carbolic added will often act as a preventive against borers and sunscald during the early stages of newly planted trees.

Brown Rot.—Self boiled Lime Sulphur.

Canker.—Cut and clean and then paint with Bordeaux paste.

Codlin Moth.—Arsenate of Lead, Paris Green and Bandage Traps from December 1st to February 28th should be examined every fourteen days, and all larvae killed; bandages to remain on the tree until June 1st and not later than July 1st. Also apply to the Department of Agriculture for a chalcid wasp parasite now being tested.

Collarot.—Cut infected part away and paint over with bluestone paste, or break down old cow manure until it becomes a thick paste, and then paint around the infected parts. This trouble is mostly due to defective drainage, and attention to that matter will often reduce it to a minimum.

Cottony Cushion.—See Oil Soda.

Crown Gall.—So far no satisfactory remedy is available, but dipping the roots in a bluestone paste (see Collarot) before planting is the only preventive available. Crop land with oats, barley, rye, cowpeas and velvet beans, which resist this trouble.

Cut Worm Bait.—Paris Green powder 1lb., bran 24lbs., salt 6ozs., water 6 to 9 quarts. Mix Paris Green and bran thoroughly while dry, then dissolve the salt in the water, and then moisten the whole mass to a stiff mash. A tablespoonful spread on the ground at the base of the tree as late in the afternoon as possible. The bait will be moist during the night, when the cut worms emerge from their hiding places to feed; may be necessary to bait twice. Spraying arsenate of lead, 1lb. to 20 gallons, on the side cut worms are approaching will help to check.

Dicky Rice.—Paris Green or Arsenate of Lead or Ostico, and can also be trapped by breaking puffy mandarins in half and placing skin side downwards under the infected trees.

Dieback of Roses.—Drastic pruning of affected growths to healthy wood as soon as noticed, while painting the stem with sulphuric acid; 1oz. to 1 gallon water is effective, or paint with Condy's Crystals, $\frac{1}{2}$ oz. to gallon water.

Exanthema, or Dieback in Citrus.—Spray early in spring. Bordeaux 6-4-80, plus red oil 1%, and, in addition, the working of 1-2lbs. of bluestone crystals around the tree, according to the age.

Foliage-eating Insects.—Arsenate of Lead or Paris Green.

Fruit Fly Bait.—Fourteen pounds (14lbs.) pollard, 1oz. white arsenic, 8oz. powdered borax, 4 gallons water. The arsenic is best dissolved by boiling in the water, then allowed to cool, and the remaining ingredients added. About 6 fluid ounces in tins in each tree, and renewed every 10 days.

Fruit Fly Lure.—Pollard 8 ozs., powdered borax 8ozs., water 1 gallon; the ingredients are thoroughly mixed and allowed to steep in water for 12 hours; then the whole is well shaken together and allowed to settle. When settled, the clear amber colored liquid is drawn off and used in the tins and the residue thrown away. Renew the lure every seven days.

Fumigation.—These processes are most efficient for San Jose, Red and Black Scale, but as we have no space for details, we recommend growers to write to the Department of Agriculture, Sydney, for the special pamphlet issued, No. 1615.

Green Fly.—Nicotine Sulph. or Oil.

Gumming or Gummosis.—Often due to heavy, badly-drained soil, or stiff, impermeable subsoil, or conditions unfavorable to the thrifty growth of the tree, due to excessive accumulation of water around the tree for a period accentuated by high fertility or excessive manuring and continuous wet weather, or freezing in spring, causing water-logging of ground, or lack of some essential plant food. Remedy faulty soil or drainage conditions, if such exist, cut away all diseased parts, clean and paint wounds with Bordeaux Paste, and, if gumming is bad, cincturing the bark with a sharp knife to allow the rank sap to escape will often have beneficial results.

Hares Eating Young Trees.—Soak a piece of soft timber in wood preserving oil, and place on stake near tree, or paint with any strong-smelling manure or other substance.

Indian Wax.—Oil Soda. Spray in February.

Leaf Curl.—Bordeaux (6.440), Lime Sulphur, winter strength, or Bluestone Soda. Spray thoroughly when dormant as soon as pruning is finished.

Lime Sulphur.—A winter spray for deciduous trees. Lime 40lbs., sulphur 80lbs., water 50 gallons. Make a paste of the sulphur with 10 gallons of hot water, then add the lime; as the lime slakes, add water as necessary; when the lime has slaked add hot water to make 50 gallons and boil for one hour, stirring constantly; add water as needed to keep up to 50 gallons of solution.

Lime, Sulphur and Salt.—Forty pounds of unslaked lime, 20lbs. of sulphur, 15lbs. of salt, and 60 gallons of water. To mix, take 10 lbs. of lime, 20 lbs of sulphur, boil until the sulphur is thoroughly dissolved, when the mixture will be of a light amber color. Slake 30lbs. of lime in a barrel with hot water, and when thoroughly slaked (but still boiling) add 15lbs. of salt; when this is dissolved the whole should be added to the lime and sulphur in the boiler, and the whole boiled for half-an-hour longer, then water, to make the whole up to 60 gallons, should be added. Strain through a wire sieve, and keep well stirred whilst in use. By first mixing the sulphur into a paste like mustard the process is quicker. A winter spray for deciduous trees.

Lime Sulphur (self boiled).—8lbs. of fresh stone lime, 8lbs. sulphur to 50 gallons of water. The lime should be placed in a barrel, and enough water poured on to almost cover it. As soon as lime begins to slake the sulphur should be added, after first sieving it to break up lumps. The mixture should be stirred and more water added as needed to form a thick paste at first, and then gradually a thin paste. The lime will supply enough heat to boil the mixture several minutes. As soon as all bubbling has ceased, check further action by adding cold water to cool the mixture and prevent further cooking. It is then ready to be strained into spray tank for use. Care should be taken that the mixture does not remain hot after it is properly slaked. Spray three to four weeks after petals have fallen. It is advisable to add 2lbs. of arsenate of lead to control any leaf-eating insects.

Mealy Bug.—Natural parasites usually control.

Maori.—A reddish brown discoloration of the skin of citrus fruit; so far no efficient remedy.

Melanose.—A blackish discoloration of the skin of citrus fruits. After blooms have dropped, all dead and diseased wood and twigs should be cut and burned. Spray with Bordeaux 3.3.50 with 1 per cent of red oil as a spreader. Spray from October to December, if necessary.

Mildew Downey.—See Bordeaux 4, 4, 40.

Mildew Powdery.—See Lime Sulphur or Bordeaux.

Mildew, Roses.—Sulphur Arsenate, Bluestone Lime, Sulphur, or Bicarb. Soda.

Mites.—Oil Nicotine Sulph. or Lime Sulph. and Salt.

Moths.—Arsenate of Lead or Paris Green.

Mussel Scale.—Nicotine Sulph. or Lime Sulphur and Salt.

Nematodes.—Very expensive and difficult to eradicate, but not to grow anything that are hosts and starve them out is best. For small areas use carbon disulphide or formaldehyde. Sprinkle on the soil and then cover tightly with old newspapers for a day or two, and then air the soil a while before sowing or planting.

Nicotine Sulphate, Black Leaf 40, or Tobacco Wash.—The former is a highly concentrated prepared solution, which is very effective, but the following wash can be used if desired:—Refuse tobacco (stems, etc.), 4lbs.; soft soap, 2lbs.; water, 10 gallons. Soak the tobacco in water for 24 hours, draw the liquor off, and boil the tobacco for three hours. Mix the two liquors after having strained off all refuse from that which has been boiled. Dissolve the soft soap by simmering in water, and add the tobacco water in the proportions named in the formula. Apply with a spray pump in early spring before the trees break into blossom. A little washing soda added to above improves it.

Oidium.—Sulphur Arsenate or Atomic Sulphur.

Oil Emulsions.—For Aphis, Olive, Red and San Jose Scales, Woolly Aphis Mites and Red Spider in winter, for Scale in July, then again in January and February.

(1) **Blue Oil Emulsion:** Twenty ounces soft soap and 4 ounces ordinary yellow soap, scraped fine; add 1 gallon of water, and boil till soap is dissolved; then add gradually 1 gallon of blue oil (sometimes called wood-preserving oil), working the mixture well together all the time, repeatedly drawing into and ejecting from a syringe. If properly done, the emulsion must be of a creamy-looking color, without free oil. To treat the trees, mix 1 pint of emulsion with 25 pints of water in winter, and about 30 for summer spray. We have found it good to add a handful of resin and a good tablespoonful of caustic soda to each mixing.

(2) **Kerosene Emulsion:** Dissolve 8 ounces of soft soap in 1 gallon boiling water; when thoroughly dissolved add 1 gallon of the best kerosene, and mix thoroughly with a syringe till the emulsion is perfectly stable and there is no free oil; add to the mixture 13 gallons of water for winter spray, and 22 for summer spray, and apply milk-warm. For Woolly Aphis, wiping the affected parts with a rag dipped in kerosene is very effective, and suitable for those only having a limited number of trees to do. Or, use 1 gallon red oil, 1 pint nicotine sulphate 40%, 2lbs. soap to 80 gallons of water.

Olive Scale.—Oil or Oil Soda.

Oil-Black Leaf 40.—1 pint Black Leaf 40 to 100 gallons of water with 1 gallon of red oil added, for Thrip and Red Spider.

Oil Soda.—8lbs. washing soda, 1 gallon red oil, 50 gallons of water; dissolve the soda in the water, add 2 gallons of this to the oil, then pour the emulsion back into the soda water. January-February the best time to spray.

Oil Sulphate.—One gallon red oil, 1 pint nicotine sulphate, 2lbs. soap, 80 gallons of water. For Woolly Aphis.

Paris Green.—1lb. Paris Green to 100 to 200 gallons water, or 1oz. to 12 gallons.

Peach Tip Moths.—Bandage Traps where late fruits ripen.

Phylloxera.—No efficient remedy; replant on proof stocks.

Phenyle Spray.—1 quart Phenyle, 3lbs. washing soda, 1 bar yellow soap, 40 gallons of water; shred soap and dissolve it in hot water, to which the other ingredients should be added and the mixture made up to 40 gallons.

Red Spider.—Oil, Nic. Sulph., Lime Sulph., Sulphur lime dust.

Red Scale.—Oil, Oil Soda, or Fumigate.

Resin and Soda.—Dissolve 6lbs. of caustic soda and 15lbs. resin over a fire in about 10 gallons of water. First grind up the resin fine, and add it to the boiling water in sprinkles, as when making porridge, and stir well. Boil till the resin is thoroughly dissolved and the mixture is of a dark brown color, and then take 1 gallon of the mixture to 10 gallons of warm water; best used warm. Spray when young scales are hatching. This must be determined by observation, and will vary in different districts. For Scale.

Rose Scale.—Lime Sulphur or Nic. Sulphur.

Rust on Roses and Citrus Trees.—Bordeaux 6, 4, 22, before buds burst.

Rutherglen Bug.—Nic. Sulphur 1 pint, 75 gallons water, Phenyle spray, or Bandage Traps.

San Jose.—Oil Sulphur, Salt, Resin, Soda, or Fumigation.

Scab, Apple and Pear.—Bordeaux, Self Boiled Lime Sulphur.

Scale, Citrus.—Resin, Soda or Fumigate.

Sour Sap.—With sharp knife scoring bark up and down in early stages only possible help.

Shot Hole.—Bordeaux, Paris Green or Arsenate of Lead.

Slug Pear and Cherry.—Arsenate of Lead, Paris Green, or dust with Lime.

Snails and Slugs.—Calcium Arsenate, 1lb. to 16lbs. bran mixed up together and spread along drills, or 265 Patent Mixture.

Sulphur.—Dust flowers with sulphur in early morning for mildew on roses.

Sulphur Arsenate.—9 parts sulphur, 1 part dry arsenate of lead dust.

Sulphur Lime.—Equal parts of sulphur and hydrated lime dusted.

Sunlight Soap Wash.—Sunlight soap 1lb., boiled in 10 gallons of water, and applied when sun is hot. A little nicotine often makes this more effective for Aphis.

Thrip.—1 pint Blackleaf, 40 to 100 gallons water with 1 gallon of red oil added. Two applications should kill.

Winter Wash.—Dissolve 1½lb. of Copper Sulphate (Bluestone) in 9 gallons of water. Pour this solution into ½ gallon of lime water made from ½lb. of lime. Churn up 5 pints of kerosene in the mixture and add 2½lbs. of caustic soda before using. For cleaning tree trunks and Red Spider preventive.

White Ants.—Where a fruit tree has been attacked by white ants, scrape away all the wood that has been perforated by the insects, tracing it as far into the ground as possible, and paint the wound with a solution made up of two parts Stockholm tar to one part of kerosene. To make the solution, warm the tar until it becomes liquefied, then add the kerosene and mix. Apply with a brush, rubbing the solution well into the wood. White ants mostly attack trees that have decayed or been bruised beneath the surface, and care should be taken, therefore, when cultivating or ploughing, not to tear the roots or strike the butt of the trees. There is no known way of preventing white ants attacking a tree affected as described, for the insects are always present in the soil, awaiting their opportunity. We have also found that common salt spread around the trees and worked lightly in the soil is a preventive against the ants attacking newly planted trees. A bait can be made up by mixing and heating 4½lbs. molasses or treacle and 1½lb. sugar, then adding ½lb. of Arsenate of Soda dissolved in ½ pint of boiling water. The whole should be thoroughly mixed and then allowed to cool. Then take two pieces of white pine, about 2ft. long by 4 to 8 in. wide, spreading a thick layer of the bait on one side, and then nail the two together with the bait on the inside surface. Bury these about 6 inches in the soil, say 8ft. from either side of the butt of the tree.

White Louse.—Atomic Sulphur or full winter strength Lime Sulphur.

Woolly Aphis.—Aphelinus, Oil Sulph., Nic. Sulphur or Oil.

L. P. ROSEN & SON

FERNHILL NURSERIES

EPPING, N.S.W., AUSTRALIA

TO THOSE ON OUR MAILING LIST

If you do not receive our Catalogue before mid-April, it has either gone astray or, by some unaccountable error, has been overlooked. A reminder will be appreciated, and the oversight rectified.

When you have finished with this Catalogue, we would esteem it a favor, and thank you to hand it to a friend. It may help him in future choosing, planting and pruning, and also help us in another way.
